[NOTE]

This documentation is part of the Java Enterprise Edition contribution to the Eclipse Foundation and is not intended for use in relation to Java Enterprise Edition or Orace GlassFish. The documentation is in the process of being revised to reflect the new Jakarta EE branding. Additional changes will be made as requirements and procedures evolve for Jakarta EE. Where applicable, references to Java EE or Java Enterprise Edition should be considered references to Jakarta EE.

Please see the Title page for additional license information.

This Application Deployment Guide describes deployment of applications and application components to GlassFish Server Open Source Edition, and includes information about deployment descriptors.

This preface contains information about and conventions for the entire GlassFish Server Open Source Edition (GlassFish Server) documentation set.

GlassFish Server 5.0 is developed through the GlassFish project open-source community at 'https://github.com/javaee/glassfish'. The GlassFish project provides a structured process for developing the GlassFish Server platform that makes the new features of the Java EE platform available faster, while maintaining the most important feature of Java EE: compatibility. It enables Java developers to access the GlassFish Server source code and to contribute to the development of the GlassFish Server. The GlassFish project is designed to encourage communication between Oracle engineers and the community.

[[overview-of-glassfish-server-open-source-edition-5.0-application-deployment]]
1 Overview of GlassFish Server Open Source Edition 5.0 Application Deployment

GlassFish Server Open Source Edition 5.0 provides an environment for developing and deploying Java applications and web services. GlassFish Server applications include Java Platform, Enterprise Edition (Java EE platform) standard features as well as features specific to GlassFish Server. This guide explains the tools and processes used for deploying applications and modules in the GlassFish Server environment. Only GlassFish Server features are described in detail in this document.

The following topics are addressed here:

- * link:#gihzx[About Application Deployment]
- * link:#giphm[About Assembly and Deployment Events]
- * link:#giifh[About Deployment Tools]
- * link:#gipud[Additional Information on Application Deployment]

Information and instructions on deploying from the command line are provided in this document. Information and instructions for accomplishing the deployment tasks by using the Administration Console are contained in the Administration Console online help.

[[gihzx]][[GSDPG00061]][[about-application-deployment]]

About Application Deployment

Assembly, also known as packaging, is the process of combining discrete components of an application or module into a single unit that can be installed on an application server. The GlassFish Server assembly process conforms to the customary Java EE specifications. The only difference is that when you assemble applications or modules in GlassFish Server, you can include optional GlassFish Server deployment descriptors that enhance functionality.

Deployment is the process of installing an application or module on GlassFish Server, optionally specifying location-specific information, such as a list of local users that can access the application, or the name of the local database. GlassFish Server deployment tools expand the archive file into an open directory structure that is ready for users. GlassFish Server deployment tools are described in link:#giifh[About

Deployment Tools].

The following topics are addressed here:

- * link:#giptw[General Deployment Functionality]
- * link:#gihzc[Deployment Descriptors and Annotations]
- * link:#gikhs[Modules and Applications]
- * link:#gijla[Access to Shared Framework Classes]
- * link:#gihzk[Naming Standards]
- * link:#gkhhv[Module and Application Versions]

[[giptw]][[GSDPG00319]][[general-deployment-functionality]]

General Deployment Functionality Λ

Various Java EE module types, such as connector module, web module, EJB module, application client module, can be deployed in the following ways:

- * Archive Deployment. Deploys the application as an archive file. For instructions, see link:deploying-applications.html#gijmq[To Deploy an Application or Module].
- * Dynamic Reloading. Redeploys the application by creating or modifying a special '.reload' file in the applications repository. For instructions, see link:deploying-applications.html#fwakh[To Reload Changes to Applications or Modules Dynamically].
- * Automatic Deployment. Deploys the application archive that is placed in the autodeployment directory. For instructions, see link:deploying-applications.html#fvxze[To Deploy an Application or Module Automatically].
- * Directory Deployment. Deploys the application in a directory format. For instructions, see link:deploying-applications.html#gilcn[To Deploy an Application or Module in a Directory Format].
- * JSR 88 Deployment. A deployment mechanism implemented based on the JSR 88 standard from 'jcp.org'. It delivers vendor neutral deployment options. See link:#beaee[JSR 88 Client] and link:#giiel[JSR 88 Naming].

A deployment plan, which deploys a portable archive along with a deployment plan containing GlassFish Server deployment descriptors, can apply to any of these deployment techniques. For instructions, see link:deploying-applications.html#gijyb[To Deploy an Application or Module by Using a Deployment Plan].

There are two work situations that require different safeguards and processes:

* A development environment provides a loose set of tools and work

spaces for a relatively small number of developers who are creating and testing applications and modules.

* A production environment provides a stable, protected environment where applications are tuned to maximum efficiency for business use rather than for development.

Some deployment methods that are used effectively in a development environment should not be used in production. In addition, whenever a reload is done, the sessions that are in transit become invalid, which might not be a concern for development, but can be a serious matter in production. The client must restart the session, another negative in a production environment.

For production environments, any upgrade should be performed as a rolling upgrade, which upgrades applications and modules without interruption in service. For more information, see link:../ha-administration-guide/rolling-upgrade.html#GSHAG00010[Upgrading Applications Without Loss of Availability] in GlassFish Server Open Source Edition High Availability Administration Guide.

[[gihzc]][[GSDPG00320]][[deployment-descriptors-and-annotations]]

Deployment Descriptors and Annotations

A deployment descriptor is an XML file that describes how a Java EE application or module should be deployed. Each deployment descriptor XML file has a corresponding Document Type Definition (DTD) file or schema (XSD) file, which defines the elements, data, and attributes that the deployment descriptor file can contain. The deployment descriptor directs a deployment tool to deploy a module or application with specific container options, and also describes specific configuration requirements that you must resolve.

Because the information in a deployment descriptor is declarative, it can be changed without requiring modifications to source code. During deployment, GlassFish Server reads the information in the deployment descriptor and deploys the application or module as directed.

The following types of deployment descriptors are associated with GlassFish Server:

* Java EE Standard Descriptors. Java EE standard deployment descriptors are described in the Java EE 8 specification. You can find the specification at 'http://www.oracle.com/technetwork/java/javaee/tech/'. Information about the XML schemas that define Java EE standard deployment descriptors is available at

`http://xmlns.jcp.org/xml/ns/javaee/`. +

The Java EE 8 specification permits the use of alternate top-level standard deployment descriptors that reside outside of the application archive using the 'alt-dd' mechanism (alternate module-level deployment descriptors were permitted prior to Java EE 7). Alternate deployment descriptors are described in the Java EE 7 specification. You can find the specification at

`http://www.oracle.com/technetwork/java/javaee/tech/`. Alternate deployment descriptors override the top-level deployment descriptors packaged in an application archive. For example, for EAR files, an alternate deployment descriptor overrides 'application.xml'. For standalone modules, an alternate deployment descriptor overrides the top-level module descriptor, such as 'web.xml'.

* GlassFish Server Descriptors. GlassFish Server provides optional deployment descriptors for configuring features that are specific to GlassFish Server. For example, when you assemble an EJB module, you annotate or create two GlassFish Server deployment descriptor files with these names: 'ejb-jar.xml' and 'glassfish-ejb-jar.xml'. If the EJB component is an entity bean with container-managed persistence (CMP), you can also create a `.dbschema` file and a `sun-cmp-mapping.xml` file. For complete descriptions of these files and their elements, see link:dd-files.html#giida[GlassFish Server Deployment Descriptor Files] and link:dd-elements.html#beaqi[Elements of the GlassFish Server Deployment Descriptors]. +

GlassFish Server also permits the use of alternate top-level GlassFish Server runtime deployment descriptors that reside outside of an application archive. Alternate GlassFish Server deployment descriptors override the top-level deployment descriptors packaged in the archive. For example, for EAR files, an alternate GlassFish Server deployment descriptor overrides 'glassfish-application.xml'. For standalone modules, an alternate GlassFish Server deployment descriptor overrides the top-level module descriptor, such as 'qlassfish-web.xml'. The name of the GlassFish Server alternate deployment descriptor file must begin with 'glassfish-'. Alternate deployment descriptors do not apply to 'sun-*.xml' deployment descriptors. +

Unless otherwise stated, settings in the GlassFish Server deployment descriptors override corresponding settings in the Java EE standard descriptors and in the GlassFish Server configuration.

An annotation, also called metadata, enables a declarative style of programming. You can specify information within a class file by using annotations. When the application or module is deployed, the information can either be used or overridden by the deployment descriptor. GlassFish Server supports annotation according to the following specifications:

^{*} http://www.jcp.org/en/jsr/detail?id=250[JSR 250 Common Annotation Specification]

^{*} http://www.jcp.org/en/jsr/detail?id=181[JSR 181 Annotation for Web

Services Specification]

* http://www.jcp.org/en/jsr/detail?id=318[EJB 3.1 Specification]

The following annotation and deployment descriptor combinations are supported:

- * Java EE applications or modules can be packaged with full Java EE compliant standard and runtime deployment descriptors. If the standard deployment descriptors have specified the 'metadata-complete' attribute, annotations in the application or module are ignored.
- * Java EE applications or modules can be fully annotated with metadata defined by the listed specifications. Annotation eliminates the need for Java EE standard deployment descriptors. In most cases, the GlassFish Server deployment descriptors are also not needed.
- * Java EE applications or modules can be partially annotated with some deployment information in standard deployment descriptors. In case of conflicts, deployment descriptor values supersede the annotated metadata, and a warning message is logged.

[[gikhs]][[GSDPG00321]][[modules-and-applications]]

Modules and Applications

An application is a logical collection of one or more modules joined by application annotations or deployment descriptors. You assemble components into JAR, WAR, or RAR files, then combine these files and, optionally, deployment descriptors into an Enterprise archive (EAR) file which is deployed.

A module is a collection of one or more Java EE components that run in the same container type, such as a web container or EJB container. The module uses annotations or deployment descriptors of that container type. You can deploy a module alone or as part of an application.

The following topics are addressed here:

- * link:#beacv[Types of Modules]
- * link:#beacu[Module-Based Deployment]
- * link:#beacw[Application-Based Deployment]

[[beacv]][[GSDPG00307]][[types-of-modules]]

Types of Modules

GlassFish Server supports the following types of modules:

```
* Web Module. A web module, also known as a web application, is a
collection of servlets, EJBs, HTML pages, classes, and other resources
that you can bundle and deploy to several Java EE application servers. A
web application archive (WAR) file is the standard format for assembling
web applications. A WAR file can consist of the following items:
servlets, JavaServer Pages (JSP) files, JSP tag libraries, utility
classes, static pages, client-side applets, beans, bean classes,
enterprise bean classes, plus annotations or web deployment descriptors
('web.xml' and 'glassfish-web.xml').
* EJB Module. An EJB module is a deployable software unit that consists
of one or more enterprise beans, plus an EJB deployment descriptor. A
Java archive (JAR) file is the standard format for assembling enterprise
beans. An EJB JAR file contains the bean classes (home, remote, local,
and implementation), all of the utility classes, and annotations or
deployment descriptors ('ejb-jar.xml' and 'glassfish-ejb-jar.xml'). If
the EJB component is a version 2.1 or earlier entity bean with container
managed persistence (CMP), you can also include a '.dbschema' file and a
CMP mapping descriptor ('sun-cmp-mapping.xml').
* Connector Module. A connector module, also known as a resource adapter
module, is a deployable software unit that provides a portable way for
EJB components to access foreign enterprise information system (EIS)
data. A connector module consists of all Java interfaces, classes, and
native libraries for implementing a resource module, plus a resource
deployment descriptor. A resource adapter archive (RAR) is the standard
format for assembling connector modules. Each GlassFish Server connector
has annotations or a deployment descriptor file ('ra.xml'). +
After deploying a J2EE connector module, you must configure it as
described in link:../application-development-
quide/connectors.html#GSDVG00013[Developing Connectors] in GlassFish Server
Open Source Edition Application Development Guide.
* Application Client Module. An application client module is a
deployable software unit that consists of one or more classes, and
application client deployment descriptors ('application-client.xml' and
'glassfish-application-client.xml'). An application client JAR file
applies to a GlassFish Server type of Java EE client. An application
client supports the standard Java EE Application Client specifications.
* Lifecycle Module. A lifecycle module provides a means of running
short-duration or long-duration Java-based tasks within the GlassFish
Server environment. Lifecycle modules are not Java EE standard modules.
See link:../application-development-guide/lifecycle-
listeners.html#GSDVG00014[Developing Lifecycle Listeners] in GlassFish Server
Open Source Edition Application Development Guide for more information.
[[beacu]][[GSDPG00308]][[module-based-deployment]]
```

Eclipse GlassFish Server Application Deployment Guide, Release 7 13

Module-Based Deployment +++++++++++++++++++

You can deploy web, EJB, and application client modules separately, outside of any application. Module-based deployment is appropriate when components need to be accessed by other modules, applications, or application clients. Module-based deployment allows shared access to a bean from a web, EJB, or application client component. The following figure shows separately-deployed EJB, web, and application client modules. [[GSDPG00001]][[fwfdj]] .*Figure 1-1 Module-Based Assembly and Deployment* image:img/dqdeploy3.png["Figure shows EJB, web, and application client module assembly and deployment."] [[beacw]][[GSDPG00309]][[application-based-deployment]] Application-Based Deployment

Application-based deployment is appropriate when components need to work together as one unit.

The following figure shows EJB, web, application client, and connector modules assembled into a Java EE application.

[[GSDPG00002]][[fvyip]]

.*Figure 1-2 Application-Based Assembly and Deployment* image:img/dgdeploya.png[

"Figure shows Java EE application assembly and deployment."]

[[gijla]][[GSDPG00322]][[access-to-shared-framework-classes]]

Access to Shared Framework Classes Λ

If you assemble a large, shared library into every module that uses it, the result is a huge file that takes too long to register with the server. In addition, several versions of the same class could exist in different class loaders, which is a waste of resources. When Java EE applications and modules use shared framework classes (such as utility classes and libraries), the classes can be put in the path for the

common class loader or an application-specific class loader rather than in an application or module.

To specify an application-specific library file during deployment, use the '--libraries' option of the 'deploy' or 'redeploy' subcommand of the 'asadmin' command. To add a library JAR file to the Common class loader directory, the Java optional package directory, or the application-specific class loader directory, use the 'add-library' subcommand. You can then list the libraries with 'list-libraries' and remove the libraries with 'remove-library'. For more information about all these commands, see the GlassFish Server Open Source Edition Reference Manual.

For more information about class loaders, see link:../application-developmentguide/class-loaders.html#GSDVG00003[Class Loaders] in GlassFish Server Open Source Edition Application Development Guide.

[NOTE]

According to the Java EE specification, section 8.1.1.2, "Dependencies," you cannot package utility classes within an individually-deployed EJB module. Instead, you must package the EJB module and utility JAR within an application using the JAR Extension Mechanism Architecture.

[[gihzk]][[GSDPG00323]][[naming-standards]]

Naming Standards

Names of applications and individually-deployed modules must be unique within a GlassFish Server domain. Modules within an application must have unique names. In addition, for enterprise beans that use container-managed persistence (CMP), the '.dbschema' file names must be unique within an application.

You should use a hierarchical naming scheme for module file names, EAR file names, module names as found in the 'module-name' portion of the 'ejb-jar.xml' files, and EJB names as found in the 'ejb-name' portion of the 'ejb-jar.xml' files. This hierarchical naming scheme ensures that name collisions do not occur. The benefits of this naming practice apply not only to GlassFish Server, but to other Java EE application servers as well.

```
The following topics are addressed here:
* link:#gjjfg[Portable Naming]
* link:#giidg[JNDI Naming]
* link:#beada[Directory Structure]
* link:#giiel[JSR 88 Naming]
[[gjjfg]][[GSDPG00310]][[portable-naming]]
Portable Naming
+++++++++++++
Starting in Java EE 6, the Java EE specification defines the portable
'application-name', which allows you to specify an application name in
the 'application.xml' file. For example:
[source,oac_no_warn]
<application-name>xyz</application-name>
The Java EE specification also defines the portable 'module-name'
element in the module standard deployment descriptors.
GlassFish Server determines the application registration name according
to the following order of precedence:

    The name specified at deployment time in the Administration Console

or in the '--name' option of the 'asadmin deploy' command is used.
2. If no name is specified at deployment time, the portable
'application-name' or 'module-name' in the Java EE deployment descriptor
is used.
3. If no name is specified at deployment time or in the deployment
descriptors, the archive name, minus the file type suffix, is used.
[[giidg]][[GSDPG00311]][[jndi-naming]]
JNDI Naming
+++++++++
Java Naming and Directory Interface (JNDI) lookup names for EJB
components must also be unique. Establishing a consistent naming
convention can help. For example, appending the application name and the
module name to the EJB name is a way to quarantee unique names, such as,
'ims/qConnPool'.
[[beada]][[GSDPG00312]][[directory-structure]]
```

Directory Structure ++++++++++++++++

Application and module directory structures must follow the structure outlined in the Java EE specification. During deployment, the application or module is expanded from the archive file to an open directory structure. The directories that hold the individual modules are named with '_jar', '_rar', and '_war' suffixes.

If you deploy a directory instead of an EAR file, your directory structure must follow this same convention. For instructions on performing directory deployment, see link:deploying-applications.html#gilcn[To Deploy an Application or Module in a Directory Format].

[[gkhhv]][[GSDPG00324]][[module-and-application-versions]]

Module and Application Versions Λ

Application and module versioning allows multiple versions of the same application to exist in a GlassFish Server domain, which simplifies upgrade and rollback tasks. At most one version of an application or module can be enabled on a server any given time. Versioning provides extensions to tools for deploying, viewing, and managing multiple versions of modules and applications, including the Administration Console and deployment-related 'asadmin' subcommands. Different versions of the same module or application can have the same context root or JNDI name. Use of versioning is optional.

The following topics are addressed here:

- * link:#gkhmg[Version Identifiers and Expressions]
- * link:#gkhmm[Choosing the Enabled Version]
- * link:#gkhob[Versioning Restrictions and Limitations]

[[gkhmg]][[GSDPG00314]][[version-identifiers-and-expressions]]

Version Identifiers and Expressions

The version identifier is a suffix to the module or application name. It is separated from the name by a colon (':'). It must begin with a letter or number. It can contain alphanumeric characters plus underscore (' '), dash ('-'), and period ('.') characters. The following examples show valid version identifiers for the 'foo' application:

```
[source,oac_no_warn]
foo:1
foo:BETA-2e
foo:3.8
foo:patch39875
A module or application without a version identifier is called the
untagged version. This version can coexist with other versions of the
same module or application that have version identifiers.
In some deployment-related 'asadmin' commands, you can use an asterisk
('*') as a wildcard character to specify a version expression, which
selects multiple version identifiers. Using the asterisk by itself after
the colon selects all versions of a module or application, including the
untagged version. The following table shows example version expressions
and the versions they select.
[width="100%",cols="33%,67%",options="header",]
|-----
|Version Expression |Selected Versions
|'foo:*' |All versions of 'foo', including the untagged version
|'foo:BETA*' |All 'BETA' versions of 'foo'
|'foo:3.*' |All '3.'x versions of 'foo'
'foo:patch*' |All 'patch' versions of 'foo'
|-----
The following table summarizes which 'asadmin' subcommands are
identifier-aware or expression-aware. All expression-aware subcommands
are also identifier-aware.
[width="100%",cols="50%,50%",options="header",]
|-----
| Identifier-Aware Subcommands | Expression-Aware Subcommands
|'deploy', 'deploydir', 'redeploy' |'undeploy'
|'enable' |'disable'
| 'list-sub-components' | 'show-component-status'
|'get-client-stubs' |'create-application-ref', 'delete-application-ref'
The 'create-application-ref' subcommand is expression-aware only if the
'--enabled' option is set to 'false'. Because the '--enabled' option is
set to 'true' by default, the 'create-application-ref' subcommand is
```

identifier-aware by default.

The 'list-applications' and 'list-application-refs' subcommands display information about all deployed versions of a module or application. To find out which version is enabled, use the '--long' option.

[[gkhmm]][[GSDPG00315]][[choosing-the-enabled-version]]

Choosing the Enabled Version

At most one version of a module or application can be enabled on a server instance. All other versions are disabled. Enabling one version automatically disables all others. You can disable all versions of a module or application, leaving none enabled.

The '--enabled' option of the 'deploy' and 'redeploy' subcommands is set to 'true' by default. Therefore, simply deploying or redeploying a module or application with a new version identifier enables the new version and disables all others. To deploy a new version in a disabled state, set the '--enabled' option to 'false'.

To enable a version that has been deployed previously, use the 'enable' subcommand.

[[gkhob]][[GSDPG00316]][[versioning-restrictions-and-limitations]]

Versioning Restrictions and Limitations

Module and application versioning in GlassFish Server is subject to the following restrictions and limitations:

- * Use of the '--name' option is mandatory for modules and applications that use versioning. There is no automatic version identifier generation.
- * GlassFish Server does not recognize any relationship between versions such as previous or later versions. All version relationships must be tracked manually.
- * There is no limit to the number of versions you can deploy except what is imposed by disk space limits.
- * A module or application in a directory should not be deployed twice with a different version identifier. To redeploy a module or application from a directory with a new version, you must use the '--force' option of the 'deploy' subcommand.
- * Database tables created or deleted as part of deployment and undeployment are global resources and cannot be qualified by an application version. Be very careful when using global resources among versions of the same application.

- * Web sessions are preserved during redeployment of a new version. However, preserving sessions among different versions of the same module or application is complex, because the key used for session variables is the same for the old and new versions.
- * Resources are created with reference to a resource-adapter's module or application name. This means that an older version's resources do not automatically refer to a newer version of the module or application. Therefore, you must explicitly create resources for a newer version of a module or application. GlassFish Server ignores duplicate exported global resources and lets deployment succeed.
- * OSGi already has its own versioning system. Therefore, when you deploy an OSGi bundle, GlassFish Server ignores any version information provided with the name but permits the deployment to succeed with warnings.

[[giphm]][[GSDPG00062]][[about-assembly-and-deployment-events]]

About Assembly and Deployment Events

The deployment tools that are provided by GlassFish Server can be used by any user authorized as an administrator to deploy applications and modules into any GlassFish Server environment. However, effective application deployment requires planning and care. Only the developer knows exactly what is required by an application, so the developer is responsible for initial assembly and deployment.

- Deployment Descriptor or Annotation Creation. The developer creates the deployment descriptors or equivalent annotations using Java standards and tools. +
- Details of the GlassFish Server deployment descriptors are contained in link:dd-files.html#giida[GlassFish Server Deployment Descriptor Files] and link:dd-elements.html#beaqi[Elements of the GlassFish Server Deployment Descriptors]. The GlassFish Server sample applications contain deployment descriptors that can be used as templates for developing deployment descriptors.
- 2. Assembly. The developer assembles the archive file(s) using Java standards and tools, such as the 'jar' command. The application or module is packaged into a JAR, WAR, RAR, or EAR file. For guidelines on naming, see link:#gihzk[Naming Standards]. +
- There are no GlassFish Server issues to consider.
- 3. Test Deployment. The developer performs a test deployment of the archive. For instructions, see link:deploying-applications.html#gijmq[To Deploy an Application or Module].
- 4. Archive Submission. The developer submits the verified archive to the administrator for deployment into a production environment. The developer includes instructions for any additional deployment tasks that the administrator must perform. For an example of such additional

instructions, see link:#gijla[Access to Shared Framework Classes].

- 5. Configuration. The administrator applies additional deployment specifics. Sometimes the developer has indicated additional deployment needs, such as specifying the production database. In this case, the administrator edits and reassembles the archive.
- 6. Production Deployment. The administrator deploys the archive to production. See link:deploying-applications.html#gijmq[To Deploy an Application or Module].
- 7. Troubleshooting. If deployment fails, the administrator returns the archive to the developer. The developer fixes the problem and resubmits the archive to the administrator. Sometimes the administrator resolves the problem, depending on what the problem is.

[[giifh]][[GSDPG00063]][[about-deployment-tools]]

About Deployment Tools

GlassFish Server provides tools for assembling and deploying a module or application.

The following topics are addressed here:

- * link:#giijz[Administration Console]
- * link:#giijf[The `asadmin` Utility]
- * link:#giijq[NetBeans IDE]
- * link:#gikwq[Eclipse IDE]
- * link:#beaee[JSR 88 Client]

[[giijz]][[GSDPG00325]][[administration-console]]

Administration Console

The GlassFish Server Administration Console is a browser-based utility that features a graphical interface that includes extensive online help for the administrative tasks. The format for starting the Administration Console in a web browser is 'http://'hostname':'port. For example:

[source,oac no warn]

http://localhost:4848

Step-by-step instructions for using the Administration Console for deployment are provided in the Administration Console online help. You can display the help material for a page by clicking the Help button. The initial help page describes the functions and fields of the page

```
itself. To find instructions for performing associated tasks, click a
link in the See Also list.
[[giijf]][[GSDPG00326]][[the-asadmin-utility]]
The 'asadmin' Utility
\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda
The GlassFish Server 'asadmin' utility is a command-line tool that
invokes subcommands for identifying the operation or task that you want
to perform. You can run 'asadmin' commands either from a command prompt
or from a script. The format for starting the 'asadmin' utility on the
command line is as-install'/bin/asadmin' subcommand --option. For
example:
[source,oac_no_warn]
asadmin list-applications --type web
Application deployment commands are listed in
link:asadmin-deployment-subcommands.html#gihzw[The 'asadmin' Deployment
Subcommands]. All GlassFish Server 'asadmin' subcommands are documented
in the link:../reference-manual/toc.html#GSRFM[GlassFish Server Open Source Edition
Reference
Manuall.
For the most part, you can perform the same administrative tasks by
using either the graphical Administration Console or the 'asadmin'
command-line utility, however, there are exceptions. Procedures for
using the command-line utilities are provided in this guide and in the
command-line help pages, which are similar to man pages. You can display
the help material for a command by typing help followed by the
subcommand. For example:
[source,oac_no_warn]
asadmin help list-applications
For additional information on the 'asadmin' utility, see
"link:../administration-quide/general-administration.html#GSADG00530[Using the
'asadmin' Utility]" in GlassFish Server Open
Source Edition Administration Guide and the
link:../reference-manual/asadmin.html#GSRFM00263['asadmin'(1M)] help page.
[[giijq]][[GSDPG00329]][[netbeans-ide]]
```

```
NetBeans IDE
\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda
You can use the NetBeans Integrated Development Environment (IDE), or
another IDE, to assemble Java EE applications and modules. The NetBeans
IDE is included in the tools bundle of the Java EE Software Development
Kit (SDK). To download, see
`http://www.oracle.com/technetwork/java/javaee/downloads/index.html`.
For additional information, see 'http://www.netbeans.org'.

[[deploying-applications]]
2 Deploying Applications
```

This chapter provides procedures and guidelines for deploying applications and modules in the GlassFish Server Open Source Editionenvironment by using the asadmin command-line utility.

The following topics are addressed here:

- Deploying Applications and Modules
- Modifying the Configuration of a Web Application or Module
- Web Module Deployment Guidelines
- EJB Module Deployment Guidelines
- Deploying a Connector Module

- Assembling and Deploying an Application Client Module
- Lifecycle Module Deployment Guidelines
- Web Service Deployment Guidelines
- OSGi Bundle Deployment Guidelines
- Transparent JDBC Connection Pool Reconfiguration
- Application-Scoped Resources

Instructions for accomplishing these tasks by using the Administration Console are contained in the Administration Console online help.

Application deployment is a dynamic process, which means that deployed applications and modules become available without requiring you to restart the server instance. Dynamic deployment can be useful in production environments to bring new applications and modules online easily. If you do restart the server, all deployed components are still deployed and available.

The following topics are addressed here:

- To Deploy an Application or Module
- To Change Targets for a Deployed Application or Module
- To List Deployed Applications or Modules
- To Redeploy an Application or Module
- To Disable an Application or Module
- To Enable an Application or Module
- To Undeploy an Application or Module
- To Reload Changes to Applications or Modules Dynamically
- To Deploy an Application or Module Automatically
- To Deploy an Application or Module by Using a Deployment Plan
- To Deploy an Application or Module in a Directory Format

Instructions for accomplishing these tasks by using the Administration Console are contained in the Administration Console online help.

To Deploy an Application or Module ^^^^^^^^

Use the deploy subcommand in remote mode to deploy an assembled application or module to GlassFish Server. If an error occurs during deployment, the application or module is not deployed. If a module within an application contains an error, the entire application is not deployed. These failures prevent a partial deployment that could leave the server in an inconsistent state.

By default, the deployment target is the default server instance, server. To deploy only to the default server instance, specify no target. If you deploy the application or module only to the domain target, it exists in the domain central repository, but no server instances or clusters can reference the component unless you add references.

You can also deploy a component to a specific stand-alone server instance or cluster. When you deploy to server instances or clusters, the application or module exists in the domain's central repository and is referenced by any clusters or server instances that you deployed to. For a cluster, the preselected deployment target is server.

If the component is already deployed or already exists, you can forcefully redeploy if you set the ---force option of the deploy subcommand to true. The redeploy subcommand also accomplishes this. See Example 2-10. You can see the enabled or disabled status of an application or module by using the show-component-status subcommand.

For information about how the application or module name is derived, see Naming Standards.

Use the --altdd or --runtimealtdd options of the deploy (and redeploy) subcommand to deploy an application or module using a top-level alternate deployment descriptor. The --altdd option specifies a top-level alternate Java EE standard deployment descriptor. The --runtimealtdd option specifies a top-level alternate GlassFish Server runtime deployment descriptor. See Example 2-3. For more information about deployment descriptors associated with GlassFish Server, see Deployment Descriptors and Annotations.

You can also specify the deployment order of an application by using the --deploymentorder option of the deploy (and redeploy) subcommand. This is useful for applications that must be loaded in a certain order at server startup. Applications with lower deployment order numbers are loaded first. See Example 2-4. If a deployment order is not specified at the time an application is deployed, the default deployment order of 100 is assigned. If two applications have the same deployment order, the application that was deployed first is loaded first at server startup.

- Ensure that the server is running.
 Remote commands require a running server.
- 2. List deployed applications by using the list-applications subcommand.
- 3. Deploy the application or module by using the deploy subcommand.

 Information about the options and properties of the subcommand is included in this help page.
- 4. If needed, fix issues and rerun the deploy subcommand.

Example 2-1 Deploying an Enterprise Application

This example deploys newApp.ear to the default server, server.

```
asadmin> deploy Cart.ear
Application deployed successfully with name Cart.
Command deploy executed successfully
```

Example 2-2 Deploying a Connector Module

This example deploys a connector module that is packaged in an RAR file.

```
asadmin> deploy jdbcra.rar
Application deployed successfully with name jdbcra.
Command deploy executed successfully
```

Example 2-3 Using an Alternate Java EE Standard Deployment Descriptor

This example deploys an application using an alternate Java EE standard deployment descriptor file that resides outside of an application archive. Specify an absolute path or a relative path to the alternate deployment descriptor file.

```
asadmin> deploy --altdd path_to_alternate_descriptor cart.ear
Application deployed successfully with name cart.
Command deploy executed successfully
```

Example 2-4 Specifying the Deployment Order of an Application

This example specifies the deployment order of two applications. The cart application is loaded before the horse application at server startup.

Some lines of output are omitted from this example for readability.

```
asadmin> deploy --deploymentorder 102 --name cart cart.war
asadmin> deploy --deploymentorder 110 --name horse horse.war
```

See Also

You can also view the full syntax and options of the subcommand by typing asadmin help deploy at the command line.

To Change Targets for a Deployed Application or Module ^^^^^^^^

After deployment, the deployed application or module exists in the central repository and can be referenced by the server instances or clusters that you deployed to as targets. The asadmin createapplication-ref and asadmin delete-application-ref subcommands enable you to add or delete targets for a deployed component. Because the application or module itself is stored in the central repository, adding or deleting targets adds or deletes the same version of the component on different targets.

- 1. Ensure that the server is running. Remote commands require a running server.
- 2. Add and remove targets by using the create-application-ref and delete-application-ref subcommands.

See Also

You can also view the full syntax and options of the subcommand by typing `asadmin help createapplication-ref` or asadmin help delete-application-ref at the command line.

To List Deployed Applications or Modules ^^^^^^^^

There are a number of commands that can be used to list deployed applications or modules and their subcomponents. Use the commands in this section in remote mode.

- 1. Ensure that the server is running. Remote commands require a running server.
- 2. List the desired applications by using the list-applications subcommand or the list-subcomponents subcommand.
 - Information about these commands is included in these help pages.
- 3. Show the status of a deployed component by using the show-component-status subcommand.

Example 2-5 Listing Applications

The list-applications subcommand lists all deployed Java EE applications or modules. If the --type option is not specified, all components are listed. This example lists deployed applications.

```
asadmin> list-applications --type web
hellojsp <web>
Command list-applications executed successfully
```

Example 2-6 Listing Subcomponents

The list-sub-components subcommand lists EJBs or servlets in a deployed module or in a module of the deployed application. If a module is not identified, all modules are listed. The --appname option functions only when the given module is standalone. To display a specific module in an application, you must specify the module name and the --appname option. This example gets the subcomponents of module mejb.jar within application MEjbApp.

```
asadmin> list-sub-components --appname MEjbApp mejb.jar
MEJBBean <StatelessSessionBean>
Command list-sub-components executed successfully
```

Example 2-7 Showing Status of a Deployed Component

The show-component-status subcommand gets the status (enabled or disabled) of the deployed component. This example gets the status of the MEjbApp component.

```
asadmin show-component-status MEjbApp
Status of MEjbApp is enabled
Command show-component-status executed successfully
```

To Redeploy an Application or Module ^^^^^

Use the redeploy subcommand in remote mode to overwrite a previously-deployed application or module. You can also accomplish this task by using the --force option of the deploy subcommand. Whenever a redeployment is done, the HTTP and SFSB sessions in transit at that time, and the EJB timers, become invalid unless you use the --keepstate=true option of the redeploy subcommand.

Before You Begin

You must remove a preconfigured resource before it can be updated.

1. Ensure that the server is running. Remote commands require a running server. Redeploy an application or module by using the redeploy subcommand or the deploy subcommand with the --force option.
 Information about the options and properties of these commands is included in these help pages.

Example 2-8 Retaining HTTP Session State During Redeployment

This example redeploys the hello web application. In a production environment, you usually want to retain sessions. If you use the --keepstate option, active sessions of the application are retained and restored when redeployment is complete.

```
asadmin> redeploy --name hello --keepstate=true hello.war
Application deployed successfully with name hello.
Command redeploy executed successfully.
```

Keep State is a checkbox option when you redeploy using the Administration Console. For instructions, see the Administration Console online help.

Example 2-9 Redeploying a Web Application That Was Deployed From a Directory

This example redeploys the hello web application, which was originally deployed from the hellodir directory.

```
asadmin>redeploy --name hellodir
Application deployed successfully with name hellodir.
Command redeploy executed successfully.
```

Example 2-10 Redeploying an Application by Using asadmin deploy --force

The --force option is set to false by default. This example redeploys newApp.ear even if has been deployed or already exists.

```
asadmin> deploy --force=true newApp.ear
Application deployed successfully with name newApp.
Command deploy executed successfully.
```

See Also

You can also view the full syntax and options of the subcommand by typing asadmin help redeploy at the command line.

To Disable an Application or Module ^^^^^^^^^

Use the disable subcommand in remote mode to immediately deactivate a deployed application or module without removing it from the server. Disabling a component makes the component inaccessible to clients. However, the component is not overwritten or uninstalled, and can be enabled by using the asadmin enable subcommand.

An application or module is enabled by default.

- 1. Ensure that the server is running. Remote commands require a running server.
- 2. Obtain the exact name of the application or module that you are disabling. To list deployed applications or modules, use the list-applications subcommand. If you do not specify a type, all deployed applications and modules are listed. For example, valid types can be web, ejb, connector, application, and webservice. To see the status of deployed components, use the show-component-status subcommand.
- 3. Deactivate the application or module by using the disable subcommand. Information about the options and properties of the subcommand is included in this help page.

Example 2-11 Listing Deployed Web Applications

This example lists all deployed web applications.

```
asadmin> list-applications --type web
hellojsp <web>
Command list-applications executed successfully.
```

Example 2-12 Disabling a Web Application

This example disables the hellojsp application.

```
asadmin> disable hellojsp
Command disable executed successfully.
```

See Also

You can also view the full syntax and options of the subcommand by typing asadmin help disable at the command line.

To Enable an Application or Module ^^^^^^

An enabled application or module is runnable and can be accessed by clients if it has been deployed to an accessible server instance or cluster. An application or module is enabled by default. Use the enable subcommand in remote mode to enable an application or module that has been disabled.

An application or module that is deployed to more than one target can be enabled on one target and disabled on another. If a component is referenced by a target, it is not available to users unless it is enabled on that target.

- 1. Ensure that the server is running. Remote commands require a running server.
- 2. Enable the application or module by using the enable subcommand. If the component has not been deployed, an error message is displayed. If the component is already enabled, it is re-enabled. To see the status of deployed components, use the showcomponent-status subcommand.

Information about the options and properties of the subcommand is included in this help page.

Example 2-13 Enabling an Application

This example enables the sampleApp application.

asadmin> enable sampleApp Command enable executed successfully.

See Also

You can also view the full syntax and options of the subcommand by typing asadmin help enable at the command line.

To Undeploy an Application or Module $^{\wedge \wedge \wedge \wedge \wedge \wedge \wedge \wedge \wedge \wedge}$

Use the undeploy subcommand in remote mode to uninstall a deployed application or module and remove it from the repository. To reinstate the component, you must deploy the component again using the deploy subcommand.

- 1. Ensure that the server is running. Remote commands require a running server.
- 2. Obtain the exact name of the application or module you are undeploying. To list deployed applications or modules, use the list-applications subcommand. If you do not specify a type, all deployed applications and modules are listed. For example, valid types can be web, ejb, connector, application, and webservice. To see the status of deployed components, use the show-component-status subcommand.
- 3. Undeploy the application or module by using the undeploy subcommand. Information about the options and properties of the subcommand is included in this help page.

Example 2-14 Listing Deployed Applications or Modules

This example lists all applications of type web.

```
asadmin> list-applications --type web
hellojsp <web>
Command list-applications executed successfully.
```

Example 2-15 Undeploying an Application

This example uninstalls the hellojsp application.

```
asadmin> undeploy hellojsp
hellojsp <web>
Command undeploy executed successfully.
```

See Also

You can also view the full syntax and options of the subcommand by typing asadmin help undeploy at the command line.

To Reload Changes to Applications or Modules Dynamically ^^^^^^^^^^^^^^^^^^^^^^

Dynamic reloading enables you to change the code or deployment descriptors of an application or module without needing to perform an explicit redeployment. Instead, you can copy the changed class files or descriptors into the deployment directory for the application or module. The server checks for changes periodically and automatically redeploys the changes if the timestamp of the

.reload file in the root directory for the application or module has changed.

Dynamic reloading is enabled by default, and is available only on the default server instance.

1. Go to the root directory of the deployed application or module. For an application:

domain-dir/applications/app-name

For an individually deployed module:

domain-dir/applications/module-name

Deployment directories might change between GlassFish Server releases.

1. Create or update the timestamp of the .reload file to load the changes.

For UNIX: touch .reload For Windows: echo> .reload

If the .reload file doesn't exist, the touch or echo command creates it.

To Deploy an Application or Module Automatically ^^^^

This task is best suited for use in a development environment.

Automatic deployment involves copying an archive file into a special autodeploy directory where the archive is automatically deployed by GlassFish Server at predefined intervals. This method is useful in a development environment because it allows new code to be tested quickly. Automatic deployment is enabled by default, and is available only on the default server instance.

- 1. Use the set subcommand to adjust the autodeployment interval.

 This sets the interval at which applications and modules are checked for code changes and dynamically reloaded. The default is 2.
- 2. Use the set subcommand to enable JSP precompilation.
- 3. Copy your archive file to the autodeploy directory.

 The default location is domain-dir`/autodeploy`. The application will be deployed at the next interval.

To undeploy an automatically deployed application or module, remove its archive file from the autodeploy directory.

Deployment directories might change between GlassFish Server releases.

Example 2-16 Setting the Autodeployment Interval

This example sets the autodeployment inverval to 3 seconds (default is 2).

asadmin> set server.admin-service.das-config.autodeploy-polling-interval-in-seconds=3 Command set executed successfully.

Example 2-17 Setting JSP Precompilation

This example enables JSP precompilation (default is false).

asadmin>

set server.admin-service.das-config.autodeploy-jsp-precompilation-enabled=true Command set executed successfully.

See Also

You can also view the full syntax and options of the subcommand by typing asadmin set --help at the command line.

To Deploy an Application or Module by Using a Deployment Plan ^^^^^^^^^^^^^^^^^^

In the deployment plan for an EAR file, the glassfish-application.xml file is located at the root. The deployment descriptor for each module is stored according to this syntax: module-name.gfdd-name, where the gf-dd-name depends on the module type. If a module named MyModule contains a CMP mappings file, the file is named MyModule.sun-cmp-mappings.xml. A .dbschema file is stored at the root level. Each / (forward slash) is replaced by a # (pound sign).

- 1. Ensure that the server is running. Remote commands require a running server.
- 2. Deploy the application or module by using the deploy subcommand with the --deploymentplan option.

Deployment directories might change between GlassFish Server releases.

Example 2-18 Deploying by Using a Deployment Plan

This example deploys the application in the myrostapp.ear file according to the plan specified by the mydeployplan.jar file.

```
asadmin>deploy --deploymentplan mydeployplan.jar myrostapp.ear
Application deployed successfully with name myrostapp.
Command deploy executed successfully.
```

Example 2-19 Deployment Plan Structure for an Enterprise Application

This listing shows the structure of the deployment plan JAR file for an EAR file.

```
$ jar -tvf mydeployplan.jar
420 Thu Mar 13 15:37:48 PST 2003 glassfish-application.xml
370 Thu Mar 13 15:37:48 PST 2003 RosterClient.war.glassfish-web.xml
418 Thu Mar 13 15:37:48 PST 2003 roster-ac.jar.glassfish-application-client.xml
1281 Thu Mar 13 15:37:48 PST 2003 roster-ejb.jar.glassfish-ejb-jar.xml
2317 Thu Mar 13 15:37:48 PST 2003 team-ejb.jar.glassfish-ejb-jar.xml
3432 Thu Mar 13 15:37:48 PST 2003 team-ejb.jar.sun-cmp-mappings.xml
84805 Thu Mar 13 15:37:48 PST 2003 team-ejb.jar.RosterSchema.dbschema
```

Example 2-20 Deployment Plan Structure for an EJB Module

In the deployment plan for an EJB module, the deployment descriptor that is specific to GlassFish Server is at the root level. If a standalone EJB module contains a CMP bean, the deployment plan includes the sun-cmp-mappings.xml and .dbschema files at the root level. In the following listing, the deployment plan describes a CMP bean:

```
$ jar r -tvf myotherplan.jar
3603 Thu Mar 13 15:24:20 PST 2003 glassfish-ejb-jar.xml
3432 Thu Mar 13 15:24:20 PST 2003 sun-cmp-mappings.xml
84805 Thu Mar 13 15:24:20 PST 2003 RosterSchema.dbschema
```

See Also

The deployment plan is part of the implementation of JSR 88. For more information about JSR 88, see JSR 88 Naming and the JSR 88 page at http://jcp.org/en/jsr/detail?id=88.

To Deploy an Application or Module in a Directory Format ^^^^^^^^^^^^^^^^^^

This task is best suited for use in a development environment.

An expanded directory, also known as an exploded directory, contains an unassembled (unpackaged) application or module. To deploy a directory format instead of an archive, file, use the asadmin deploy subcommand in remote mode and specify a path to a directory instead of to an archive file. The contents of the directory must be the same as the contents of a corresponding archive file, with one exception. An application archive file contains archive files for its modules, for example myUI.war and myEJB.jar. The expanded application directory contains expanded directories for the modules, for example myUI_war and myEJB_jar, instead. .

You can change deployment descriptor files directly in the expanded directory.

If your environment is configured to use dynamic reloading, you can also dynamically reload applications or modules that are deployed from the directory. For instructions, see To Reload Changes to Applications or Modules Dynamically.

Unlike archive file deployment, directory deployment does not copy the directory contents to the remote hosts. This means that for deployment to a cluster, the directory path may exist for both the DAS and the remote server instances but may not actually correspond to the same physical location. If any target server instance cannot see the deployed directory, or finds that it contains different files from those detected by the DAS, deployment fails.

Integrated development environments (IDEs) typically use directory deployment, so you do not need to deal directly with the expanded format.

Before You Begin

On each cluster or stand-alone server instance to which the application or module is deployed, the directory must be accessible and must contain the same files as found by the DAS.

On Windows, if you are deploying a directory on a mapped drive, you must be running GlassFish Server as the same user to which the mapped drive is assigned. This enables GlassFish Server to access the directory.

- 1. Ensure that the server is running. Remote commands require a running server.
- 2. Verify that the expanded directory contents match the archive file. For information about the required directory contents, see the appropriate specifications.
- 3. Deploy the directory by using the deploy subcommand and specifying the path to the expanded directory.

Deployment directories might change between GlassFish Server releases.

Example 2-21 Deploying an Application From a Directory

This example deploys the expanded directory /apps/MyApp for the hello application.

asadmin> deploy --name hello /apps/MyApp Application deployed successfully with name hello. Command deploy executed successfully.

See Also

You can also view the full syntax and options of the subcommand by typing asadmin help deploy at the command line.

Modifying the Configuration of a Web Application or Module~

You can modify the configuration of a web application or a module by modifying the deployment descriptors and then repackaging and redeploying the application.

The instructions in this section enable you to change the configuration of a deployed application without the need to modify the application's deployment descriptors and repackage and redeploy the application. If the application or module entry is unset, its value reverts to the value, if any, that is set in the application's deployment descriptor.

The following topics are addressed here:

- To Set a Web Context Parameter
- To Unset a Web Context Parameter
- To List Web Context Parameters
- To Set a Web Environment Entry
- To Unset a Web Environment Entry
- To List Web Environment Entries

To Set a Web Context Parameter ^^^^^

Use the set-web-context-param subcommand in remote mode to change the configuration of a deployed application without the need to modify the application's deployment descriptors and repackage and redeploy the application. By using this subcommand, you are either adding a new parameter that did not appear in the original web module's descriptor, or overriding the descriptor's setting of the parameter.

If the --ignoreDescriptorItem option is set to true, then the server ignores any setting for that

context parameter in the descriptor, which means you do not need to specify an overriding value on the set-web-context-param subcommand. The server behaves as if the descriptor had never contained a setting for that context parameter.

This subcommand sets a servlet context-initialization parameter of one of the following items:

- A deployed web application
- A web module in a deployed Java Platform, Enterprise Edition (Java EE) application

Before You Begin

The application must already be deployed. Otherwise, an error occurs.

- 1. Ensure that the server is running. Remote commands require a running server.
- 2. Set a servlet context-initialization parameter by using the set-web-context-param subcommand. Information about the options for the subcommand is included in this help page.

Example 2-22 Setting a Servlet Context-Initialization Parameter for a Web Application

This example sets the servlet context-initialization parameter javax.faces.STATE_SAVING_METHOD of the web application basic-ezcomp to client.

```
asadmin> set-web-context-param --name=javax.faces.STATE SAVING METHOD
--description="The location where the application?s state is preserved"
--value=client basic-ezcomp
Command set-web-context-param executed successfully.
```

See Also

You can also view the full syntax and options of the subcommand by typing asadmin help set-webcontext-param at the command line.

To Unset a Web Context Parameter ^^^^^^^^^

Use the unset-web-context-param subcommand in remote mode to unset an environment entry for a deployed web application or module that has been set by using the set-web-env-entry subcommand. There is no need to modify the application's deployment descriptors and repackage and redeploy the application.

This subcommand unsets an environment entry for one of the following items:

- A deployed web application
- A web module in a deployed Java Platform, Enterprise Edition (Java EE) application

When an entry is unset, its value reverts to the value, if any, that is set in the application's deployment descriptor. This subcommand cannot be used to change the value of an environment entry that is set in an application's deployment descriptor. Instead, use the set-web-context-param subcommand for this purpose.

Before You Begin

The application must already be deployed, and the entry must have previously been set by using the set-web-env-entry subcommand. Otherwise, an error occurs.

- Ensure that the server is running.
 Remote commands require a running server.
- 2. Unset an environment entry by using the unset-web-context-param subcommand. Information about the options for the subcommand is included in this help page.

Example 2-23 Unsetting a Servlet Context-Initialization Parameter for a Web Application

This example unsets the servlet context-initialization parameter javax.faces.STATE_SAVING_METHOD of the web application basic-ezcomp.

```
asadmin> unset-web-context-param
--name=javax.faces.STATE_SAVING_METHOD basic-ezcomp
Command unset-web-context-param executed successfully.
```

See Also

You can also view the full syntax and options of the subcommand by typing asadmin help unset-web-context-param at the command line.

To List Web Context Parameters ^^^^^

Use the list-web-context-param subcommand in remote mode to list the parameters that have previously been set by using the set-web-context-param subcommand. The subcommand does not list parameters that are set only in the application's deployment descriptor. For each parameter, the following information is displayed:

- The name of the parameter
- The value to which the parameter is set

- The value of the --ignoreDescriptorItem option of the set-web-context-param subcommand that was specified when the parameter was set
- The description of the parameter or null if no description was specified when the parameter
 - 1. Ensure that the server is running. Remote commands require a running server.
 - 2. List servlet context-initialization parameters by using the list-web-context-param subcommand.

Example 2-24 Listing Servlet Context-Initialization Parameters for a Web Application

This example lists all servlet context-initialization parameters of the web application basic-ezcomp that have been set by using the set-web-context-param subcommand. Because no description was specified when the javax.faces.PROJECT_STAGE parameter was set, null is displayed instead of a description for this parameter.

```
asadmin> list-web-context-param basic-ezcomp
javax.faces.STATE_SAVING_METHOD = client ignoreDescriptorItem=false
//The location where the application's state is preserved
javax.faces.PROJECT STAGE = null ignoreDescriptorItem=true //null
Command list-web-context-param executed successfully.
```

See Also

You can also view the full syntax and options of the subcommand by typing asadmin help listweb-context-param at the command line.

To Set a Web Environment Entry ^^^^^

An application uses the values of environment entries to customize its behavior or presentation. Use the set-web-env-entry subcommand in remote mode to change the configuration of a deployed application without the need to modify the application's deployment descriptors and repackage and redeploy the application. By using this subcommand, you are either adding a new parameter that did not appear in the original web module's descriptor, or overriding the descriptor's setting of the parameter.

If you the --ignoreDescriptorItem option is set to true, then the server ignores any setting for that environment entry in the descriptor, which means you do not need to specify an overriding value on the set-web-env-entry subcommand. The server behaves as if the descriptor had never contained a setting for that environment entry.

This subcommand sets an environment entry for one of the following items:

- A deployed web application
- A web module in a deployed Java Platform, Enterprise Edition (Java EE) application

Before You Begin

The application must already be deployed. Otherwise, an error occurs.

- Ensure that the server is running.
 Remote commands require a running server.
- 2. Set an environment entry for a deployed web application or module by using the set-web-env-entry subcommand.

Information about the options for the subcommand is included in this help page.

Example 2-25 Setting an Environment Entry for a Web Application

This example sets the environment entry Hello User of the application hello to techscribe. The Java type of this entry is java.lang.String.

```
asadmin> set-web-env-entry --name="Hello User"
--type=java.lang.String --value=techscribe
--description="User authentication for Hello appplication" hello
Command set-web-env-entry executed successfully
```

See Also

You can also view the full syntax and options of the subcommand by typing asadmin help set-web-env-entry at the command line.

To Unset a Web Environment Entry ^^^^^^^^^^

Use the unset-web-env-entry subcommand in remote mode to unset an environment entry for a deployed web application or module.

- Ensure that the server is running.
 Remote commands require a running server.
- Unset a web environment entry by using the unset-web-env-entry subcommand.
 Information about the options for the subcommand is included in this help page.

Example 2-26 Unsetting an Environment Entry for a Web Application

This example unsets the environment entry Hello User of the web application hello.

```
asadmin> unset-web-env-entry --name="Hello User" hello
Command unset-web-env-entry executed successfully.
```

See Also

You can also view the full syntax and options of the subcommand by typing asadmin help unsetweb-env-entry at the command line.

To List Web Environment Entries ^^^^^^^

Use the list-web-env-entry subcommand to list environment entries for a deployed web application or module. For each entry, the following information is displayed:

- The name of the entry
- The Java type of the entry
- The value to which the entry is set
- The description of the entry or null if no description was specified when the entry was set
- The value of the --ignoreDescriptorItem option of the set-web-env-entry subcommand that was specified when the entry was set
 - 1. Ensure that the server is running. Remote commands require a running server.
 - 2. List the environment entries by using theolist-web-env-entry subcommand.

Example 2-27 Listing Environment Entries for a Web Application

This example lists all environment entries that have been set for the web application hello by using the set-web-env-entry subcommand.

```
asadmin> list-web-env-entry hello
Hello User (java.lang.String) = techscribe ignoreDescriptorItem=false
//User authentication for Hello appplication
Hello Port (java.lanq.Integer) = null ignoreDescriptorItem=true //null
Command list-web-env-entry executed successfully.
```

See Also

You can also view the full syntax and options of the subcommand by typing asadmin help list-web-env-entry at the command line.

The following guidelines apply to deploying a web module in GlassFish Server:

- Context Root. When you deploy a web module, if you do not specify a context root, the default is the name of the WAR file without the .war extension. The web module context root must be unique within the server instance.
 - The domain administration server (DAS) in GlassFish Server versions 2.1.1 and later supports the deployment of multiple web applications using the same web context root as long as those applications are deployed to different GlassFish Server stand-alone instances. Deploying multiple applications using the same context root within a single instance produces an error.
- Data Source. If a web application accesses a DataSource that is not specified in a resource-ref in glassfish-web.xml, or there is no glassfish-web.xml file, the resource-ref-name defined in web.xml is used. A warning message is logged, recording the JNDI name that was used to look up the resource.
- Virtual Servers. If you deploy a web application and do not specify any assigned virtual servers, the web application is assigned to all currently-defined virtual servers with the exception of the virtual server with ID __asadmin, which is reserved for administrative purposes. If you then create additional virtual servers and want to assign existing web applications to them, you must redeploy the web applications.
- HTTP Sessions. If a web application is undeployed, all its HTTP sessions will be invalidated and removed, unless the application is being undeployed as part of a redeployment and the --keepstate deployment option was set to true. This option is not supported and ignored in a clustered environment. See Example 2-8.
 - For information about HTTP session persistence, see the GlassFish Server Open Source Edition High Availability Administration Guide.
- Load Balancing. See the GlassFish Server Open Source Edition High Availability Administration Guide for information about load balancing.
- JSP Precompilation. You can precompile JSP files during deployment by checking the appropriate box in the Administration Console, or by using the --precompilejsp option of the deploy subcommand.
 - You can keep the generated source for JSP files by adding the keepgenerated flag to the jsp-config element in glassfish-web.xml. For example:

```
<glassfish-web-app>
   <jsp-config>
      property name=keepgenerated value=true />
   </isp-config>
</glassfish-web-app>
```

If you include this property when you deploy the WAR file, the generated source is kept in domain-dir`/generated/jsp/app-name/module-name domain-dir for application, /generated/jsp/module-name for an individually-deployed web module.

For more information about JSP precompilation, see 'jsp-config. * Web Context Parameters. You can set web context parameters after deployment. See the following sections:

- To Set a Web Context Parameter
- To Unset a Web Context Parameter
- To List Web Context Parameters
 - Web Environment Entries. You can set web environment entries after deployment. See the following sections:
- To Set a Web Environment Entry
- To Unset a Web Environment Entry
- To List Web Environment Entries

The GlassFish Server Web Profile supports the EJB 3.1 Lite specification, which allows enterprise beans within web applications, among other features. The GlassFish Server Full Platform Profile supports the entire EJB 3.1 specification. For details, see ISR 318

The following guidelines apply to deploying an EJB module in GlassFish Server:

• [NDI Name. — If no [NDI name for the E]B [AR module is specified in the jndi-name element immediately under the ejb element in glassfish-ejb-jar.xml, or there is no glassfish-ejbjar.xml file, a default, non-clashing JNDI name is derived. A warning message is logged, recording the JNDI name used to look up the EJB JAR module. Because the EJB 3.1 specification defines portable EJB JNDI names, there is less need for GlassFish Server specific JNDI names. By default, GlassFish Server specific default JNDI names are applied automatically for backward compatibility. To disable GlassFish Server specific JNDI names for an EJB module, set the value of the <disable-nonportable-jndi-names> element in the glassfish-ejb-jar.xml file to true. The default is false.

- Stateful Session Bean and Timer State. Use the --keepstate option of the redeploy subcommand or the <keepstate> element in the glassfish-ejb-jar.xml file to retain stateful session bean instances and persistently created EJB timers across redeployments. The --keepstate option of the redeploy subcommand takes precedence. The default for both is false. This option is not supported and ignored in a clustered environment.
 - Some changes to an application between redeployments can prevent this feature from working properly. For example, do not change the set of instance variables in the SFSB bean class. Other examples would be changes to EJB names, or adding or removing EJBs to or from an application.
- EJB Singletons. EJB Singletons are created for each server instance in a cluster, and not once per cluster.
- Stubs and Ties. Use the get-client-stubs subcommand in remote mode to retrieve stubs and ties.
- Compatibility of JAR Visibility Requirements. Use the compatibility element of the glassfish-application.xml or glassfish-ejb-jar.xml file to specify the GlassFish Server release with which to be backward compatible in terms of JAR visibility requirements for applications. The current allowed value is v2, which refers to GlassFish Server version 2 or GlassFish Server version 9.1 or 9.1.1. Starting in Java EE 6, the Java EE specification imposes stricter requirements than Java EE 5 did on which JAR files can be visible to various modules within an EAR file. Setting this element to v2 removes these Java EE 6 and later restrictions.

Deploying a Connector Module ----~

Deploying a stand-alone connector module allows multiple deployed Java EE applications to share the connector module. A resource adapter configuration is automatically created for the connector module.

The following topics are addressed here:

- To Deploy and Configure a Stand-Alone Connector Module
- Redeploying a Stand-Alone Connector Module
- Deploying and Configuring an Embedded Resource Adapter

To Deploy and Configure a Stand-Alone Connector Module ^^^^^^^^

As an alternative to Step 3 through Step 6, you can define application-scoped resources in the glassfish-resources.xml deployment descriptor. For more information, see Application-Scoped Resources.

Ensure that the server is running.
 Remote commands require a running server.

- 2. Deploy the connector module by using the deploy subcommand.
- 3. Configure connector connection pools for the deployed connector module. Use the create-connector-connection-pool subcommand. For procedures, see "To Create a Connector Connection Pool" in GlassFish Server Open Source Edition Administration Guide.
- 4. Configure connector resources for the connector connection pools. Use the create-resource-adapter-config subcommand. For procedures, see "To Create Configuration Information for a Resource Adapter" in GlassFish Server Open Source Edition Administration Guide. If needed, you can override the default configuration properties of a resource adapter.
 - This step associates a connector resource with a JNDI name.
- 5. Configure a resource adapter. Use the create-resource-adapter-config subcommand. For procedures, see "To Create Configuration Information for a Resource Adapter" in GlassFish Server Open Source Edition
 - Administration Guide. If needed, you can override the default configuration properties of a resource adapter.
- 6. If needed, create an administered object for an inbound resource adapter. Use the create-admin-object subcommand. For procedures, see "To Create an Administered Object" in GlassFish Server Open Source Edition Administration Guide.

Redeploying a Stand-Alone Connector Module ^^^^^

Redeployment of a connector module maintains all connector connection pools, connector resources, and administered objects defined for the previously deployed connector module. You do not need to reconfigure any of these resources.

However, you should redeploy any dependent modules. A dependent module uses or refers to a connector resource of the redeployed connector module. Redeployment of a connector module results in the shared class loader reloading the new classes. Other modules that refer to the old resource adapter classes must be redeployed to gain access to the new classes. For more information about class loaders, see "Class Loaders" in GlassFish Server Open Source Edition Application Development Guide.

During connector module redeployment, the server log provides a warning indicating that all dependent applications should be redeployed. Client applications or application components using the connector module's resources may throw class cast exceptions if dependent applications are not redeployed after connector module redeployment.

To disable automatic redeployment, set the --force option to false. In this case, if the connector module has already been deployed, GlassFish Server provides an error message.

Deploying and Configuring an Embedded Resource Adapter ^^^^^^^^^

A connector module can be deployed as a Java EE component in a Java EE application. Such connectors are only visible to components residing in the same Java EE application. Deploy this application as you would any other Java EE application.

You can create new connector connection pools and connector resources for a connector module embedded within a Java EE application by prefixing the connector name with app-name`#. For example, if an application `appX.ear has jdbcra.rar embedded within it, the connector connection pools and connector resources refer to the connector module as appX#jdbcra.

An embedded connector module cannot be undeployed using the name app-name`#`connector-name. To undeploy the connector module, you must undeploy the application in which it is embedded.

The association between the physical JNDI name for the connector module in GlassFish Server and the logical JNDI name used in the application component is specified in the GlassFish Server-specific XML descriptor glassfish-ejb-jar.xml.

Assembling and Deploying an Application Client Module -----~~

Deployment is necessary for application clients that communicate with EJB components or that use Java Web Start launch support. Java Web Start is supported for application clients and for applications that contain application clients. By default, Java Web Start is enabled in application clients and in GlassFish Server.

The Application Client Container is supported only in the GlassFish Server Full Platform Profile, not in the Web Profile.

The following topics are addressed here:

- To Assemble and Deploy an Application Client
- To Prepare Another Machine for Running an Application Client
- To Undeploy an Application Client

To Assemble and Deploy an Application Client ^^^^^^^^^^

- 1. Assemble the necessary client components. The client JAR file is created.
- 2. Assemble the EJB components that are to be accessed by the client. The EJB JAR file is created.

- 3. Assemble the client and EJB JAR files together in an EAR. An EAR file contains all the components of the application.
- 4. Deploy the application. Instructions are contained in To Deploy an Application or Module.
- 5. If you are using the appclient script to run the application client, retrieve the client files. The client artifacts contain the ties and necessary classes for the application client. In this release of GlassFish Server, the client artifacts include multiple files. You can use either the get-client-stubs subcommand or the --retrieve option of the deploy subcommand, but you do not need to use both.
 - Use the deploy subcommand with the --retrieve option to retrieve the client files as part of deploying the application.
 - Use the get-client-stubs subcommand to retrieve client files for a previously-deployed application.
- 6. Test the client on the GlassFish Server machine in one of the following ways:
 - If Java Web Start is enabled for the application client, use the Launch link on the Application Client Modules.
 - Run an application client by using the appclient script. The appclient script is located in the as-install 'bin' directory. If you are using the default server instance, the only required option is -client, which points to the client JAR file. For example:

```
appclient -client converterClient.jar
```

The -xml parameter, which specifies the location of the sun-acc.xml file, is also required if you are not using the default instance.

See Also

For more detailed information about the appclient script, see appclient(1M).

For more detailed information about creating application clients, see "Developing Java Clients" in GlassFish Server Open Source Edition Application Development Guide. This chapter includes information on the following topics:

- Accessing EJB components and JMS resources from application clients
- Connecting to a remote EJB module through a firewall
- Using Java Web Start and creating a custom JNLP file
- Using libraries with application clients
- Specifying a splash screen, login retries, and other customizations

To Prepare Another Machine for Running an Application Client ^^^^^^^^

If Java Web Start is enabled, the default URL format for an application is http://`host:port/`context-root. For example:

```
http://localhost:80/myapp
```

The default URL format for a standalone application client module is http://`host:port/`module-id. For example:

```
http://localhost:80/myclient
```

To set a different URL for an application client, set the context-root subelement of the java-web-start-access element in the glassfish-application-client.xml file.

If the context-root or module-id is not specified during deployment, the name of the EAR or JAR file without the .ear or .jar extension is used. For an application, the relative path to the application client JAR file is also included. If the application or module is not in EAR or JAR file format, a context-root or module-id is generated. Regardless of how the context-root or module-id is determined, it is written to the server log. For details about naming, see Naming Standards.

Before You Begin

This task applies if you want to use the appclient script to run the application client on a system other than where the server runs.

- 1. Create the application client package JAR file.

 Use the package-appclient script in the as-install`/bin` directory. This JAR file is created in the as-install`/lib/appclient` directory.
- 2. Copy the application client package JAR file to the client machine.
- 3. Extract the contents of the JAR file. For example: jar xf filename`.jar`
- 4. Configure the sun-acc.xml file.
 - If you used the package-appclient script, this file is located in the appclient/appserv/lib/appclient directory by default.
- 5. Configure the asenv.conf (asenv.bat on Windows) file.

 This file is located in appclient/appserv/bin by default if you used the package-appclient script.
- 6. Copy the client JAR file to the client machine. You are now ready to run the client.

See Also

For more detailed information about Java Web Start and the package-appclient script, see appclient(1M).

To Undeploy an Application Client ^^^^^

After application clients are downloaded, they remain on the client until they are manually removed. Use the Java Web Start control panel to discard downloaded application clients that used Java Web Start.

If you undeploy an application client, you can no longer use Java Web Start, or any other mechanism, to download that application client because it might be in an inconsistent state. If you try to launch an application client that was previously downloaded (even though the server side of the application client is no longer present), the results are unpredictable unless the application client has been written to tolerate such situations.

You can write your application client so that it detects failures in contacting server-side components, but continues running. In this case, Java Web Start can run an undeployed application client while the client is cached locally. For example, your application client can be written to detect and then recover from javax.naming.NamingException when locating a resource, or from java.rmi.RemoteException when referring to a previously-located resource that becomes inaccessible.

A lifecycle module, also called a lifecycle listener module, provides a means of running long or short Java-based tasks within the GlassFish Server environment, such as instantiation of singletons or RMI servers. Lifecycle modules are automatically initiated at server startup and are notified at various phases of the server life cycle. All lifecycle module interfaces are in the asinstall \modules/glassfish-api.jar \file.

For general information about lifecycle modules, see "Developing Lifecycle Listeners" in GlassFish Server Open Source Edition Application Development Guide.

You can deploy a lifecycle module using the create-lifecycle-module subcommand. Do not use asadmin deploy or related commands.

You do not need to specify a classpath for the lifecycle module if you place it in the domaindir`/lib` or domain-dir`/lib/classes` directory for the Domain Administration Server (DAS). Do not place it in the lib directory for a particular server instance, or it will be deleted when that instance synchronizes with the GlassFish Server.

After you deploy a lifecycle module, you must restart the server. During server initialization, the server instantiates the module and registers it as a lifecycle event listener.

If the --failurefatal option of create-lifecycle-module is set to true (the default is false), lifecycle module failure prevents server initialization or startup, but not shutdown or termination.

Web Service Deployment Guidelines

If you installed the Web Profile, web services are not supported unless the optional Metro Web Services Stack add-on component is downloaded. Without the Metro add-on component, a servlet or EJB component cannot be a web service endpoint, and the <code>glassfish-web.xml</code> and <code>glassfish-ejb-jar.xml</code> elements related to web services are ignored.

The following guidelines apply when deploying a web service in GlassFish Server:

- Web Service Endpoint. Deploy a web service endpoint to GlassFish Server as you would any servlet or stateless session bean. If the deployed application or module has a web service endpoint, the endpoint is detected automatically during deployment. The GlassFish Server -specific deployment descriptor files, glassfish-web.xml and glassfish-ejb-jar.xml, provide optional web service enhancements in their webservice-endpoint and webservice-description elements.
- Web Service Management. Web service management is fully supported in the Administration Console. After the application or module is deployed, click the Web Service component. The table in the right frame lists deployed web service endpoints.

For more information about web services, see "Developing Web Services" in GlassFish Server Open Source Edition Application Development Guide.

OSGi Bundle Deployment Guidelines

To deploy an OSGi bundle using the Administration Console, select Other from the Type drop-down list and check the OSGI Type checkbox.

To deploy an OSGi bundle using the asadmin deploy command, set the --type option to the value osqi. For example:

asadmin> deploy --type=osgi MyBundle.jar

To automatically deploy an OSGi bundle, copy the bundle archive to the domain-dir`/autodeploy/bundles` directory.

For components packaged as OSGi bundles (--type=osgi), the deploy subcommand accepts properties arguments to wrap a WAR file as a WAB (Web Application Bundle) at the time of deployment. The subcommand looks for a key named UriScheme and, if present, uses the key as a URL stream handler to decorate the input stream. Other properties are used in the decoration process. For example, the GlassFish Server OSGi web container registers a URL stream handler named webbundle, which is used to wrap a plain WAR file as a WAB.

Transparent JDBC Connection Pool Reconfiguration

In this GlassFish Server release, reconfiguration of a JDBC connection pool due to attribute or property changes can be transparent to the applications or modules that use the pool, even if pool reconfiguration results in pool recreation. You do not need to redeploy the application or module.

To enable transparent pool reconfiguration, set the dynamic-reconfiguration-wait-timeout-inseconds property. This property specifies the timeout for dynamic reconfiguration of the pool. Inprogress connection requests must complete before this timeout expires or they must be retried. New connection requests wait for this timeout to expire before acquiring connections to the reconfigured pool. If this property exists and has a positive value, it is enabled.

You can set this property in the glassfish-resources.xml file. For more information, see the property descriptions under jdbc-connection-pool.

For JDBC connection pools that are not application-scoped, use the set subcommand to set this property. For example, to configure mypool on myserver, type the following all on one line:

asadmin> set myserver.resources.jdbc-connection-pool.mypool.property. dynamic-reconfiguration-wait-timeout-in-seconds=30

You can define an application-scoped JDBC resource or other resource for an enterprise application, web module, EJB module, connector module, or application client module. This allows single-step deployment for resource-dependent modules and applications. An application-scoped resource has the following characteristics:

- It is available only to the module or application that defines it.
- It cannot be referenced or looked up by other modules or applications.
- It is created during deployment, destroyed during undeployment, and recreated during redeployment.

• It is free from unexpected resource starvation or delay in acquiring connections because no other application or module competes for accesses to it.

The following resource types can be application-scoped:

- JDBC connection pools
- JDBC resources
- Connector connection pools
- Connector resources
- Resource adapters
- External JNDI resources
- Custom resources
- Admin object resources
- JavaMail resources

Deployment Descriptor. An application-scoped resource is defined in the <code>glassfish-resources.xml</code> deployment descriptor file. This file is placed in the <code>META-INF</code> directory of the module or application archive. For web applications or modules, this file is placed in the <code>WEB-INF</code> directory. If any submodule archives of an enterprise application archive have their own <code>glassfish-resources.xml</code> files, the resource definitions are scoped to those modules only. For more information about the <code>glassfish-resources.xml</code> file, see <code>GlassFish Server Deployment Descriptor Files</code> and <code>Elements</code> of the <code>GlassFish Server Deployment Descriptors</code>.

Naming. Application-scoped resource JNDI names begin with <code>java:app</code> or <code>java:module</code>. If one of these prefixes is not specified in the JNDI name, it is added. For example, application-scoped databases have JNDI names in the following format: <code>`java:app/jdbc/`DataSourceName</code> or <code>`java:module/jdbc/`DataSourceName</code>. This is in accordance with the naming scopes introduced in the Java EE 6 Specification.

Errors. Application-scoped resource definitions with same resource name, resource type, attributes, and properties are duplicates. These generate WARNING level log messages and deployment continues. Definitions with the same resource name and type but different attributes or properties are conflicts and cause deployment failure. When an application or module tries to look up a scoped resource that does not belong to it, a naming exception is thrown.

Redeployment. When an application or module is undeployed, its scoped resources are deleted. During redeployment, resources are destroyed and recreated based on changes in the <code>glassfish-resources.xml</code> file. To preserve old resource definitions during redeployment, use the <code>preserveAppScopedResources</code> property of the <code>redeploy</code> (or <code>deploy --force=true</code>) subcommand. For example:

```
asadmin> redeploy --property preserveAppScopedResources=true MyApp.ear
asadmin> deploy --force=true --property preserveAppScopedResources=true MyApp.ear
```

For more information, see redeploy(1) and deploy(1).

Listing. Use the --resources option of the list-applications subcommand to list applicationscoped resources. Use the --subcomponents option in addition to list scoped resources for enterprise application modules or for module subcomponents. To list scoped resources for subcomponents only, use the --resources option of the list-subcomponents subcommand

For more information, see list-applications(1) and list-sub-components(1).

Restrictions. Use of application-scoped resources is subject to the following restrictions:

- resource-adapter-config and connector-work-security-map These can only be specified in the glassfish-resources.xml file of the corresponding connector module. In an enterprise application, the resource-adapter-config or connector-work-security-map for an embedded connector module must be specified in the glassfish-resources.xml file of the connector module. You cannot specify a resource-adapter-config or connector-work-security-map in an application for a connector module that is not part of the application.
- Resource to connection pool cross references A module-level jdbc-resource cannot reference an application-level jdbc-connection-pool. Likewise, a module-level connectorresource cannot reference an application-level connector-connection-pool.
- Global resources Defining java: global INDI names is not supported.
- Cross definitions Defining java:app JNDI names at the module level is not supported.

A The asadmin Deployment Subcommands

```
This appendix lists the 'asadmin' deployment subcommands that are
included with this release of the GlassFish Server Open Source
Editionsoftware. For information on additional 'asadmin' subcommands,
see "link:../administration-guide/asadmin-subcommands.html#GSADG00023[Subcommands for
the 'asadmin' Utility]" in
GlassFish Server Open Source Edition Administration Guide or see the
link:../reference-manual/toc.html#GSRFM[GlassFish Server Open Source Edition
Reference Manual].
link:../reference-manual/add-library.html#GSRFM00818['add-library']::
  Adds one or more library JAR files to GlassFish Server. You can
```

specify whether the libraries are added to the Common class loader

directory, the Java optional package directory, or the

```
application-specific class loader directory.
link:../reference-manual/create-application-ref.html#GSRFM00013['create-application-
ref`l::
  Creates a reference from a cluster or an unclustered server instance
  to a previously deployed Java EE application or module. This
  effectively results in the application element being deployed and made
  available on the targeted instance or cluster.
link:../reference-manual/create-lifecycle-module.html#GSRFM00043[`create-lifecycle-
module`l::
  Creates a lifecycle module. A lifecycle module provides a means of
  running a short or long duration Java-based task at a specific stage
  in the server life cycle.
link:../reference-manual/delete-application-ref.html#GSRFM00064['delete-application-
ref`]::
  Removes a reference from a cluster or an unclustered server instance
  to a previously deployed Java EE application or module. This
  effectively results in the application element being undeployed on the
  targeted instance or cluster.
link:../reference-manual/delete-lifecycle-module.html#GSRFM00095[`delete-lifecycle-
module`l::
  Deletes a lifecycle module.
link:../reference-manual/deploy.html#GSRFM00114['deploy']::
  Deploys an enterprise application, web application, EJB module,
  connector module, or application client module. If the component is
  already deployed or already exists, you can forcefully redeploy if you
  set the '--force' option to 'true'. A directory can also be deployed.
  Supported in remote mode only. For usage instructions, see
  link:deploying-applications.html#gijmq[To Deploy an Application or
  Module1.
link:../reference-manual/deploydir.html#GSRFM00115['deploydir']::
  This subcommand is deprecated. Use the 'deploy' subcommand instead.
link:../reference-manual/disable.html#GSRFM00116['disable']::
  Immediately deactivates the named application or module. If the
  component has not been deployed, an error message is returned.
  Supported in remote mode only. For usage instructions,
  seelink:deploying-applications.html#fvyje[To Disable an Application or
  Module].
link:../reference-manual/enable.html#GSRFM00124['enable']::
  Enables the specified application or module. If the component has not
  been deployed, an error message is returned. If the component is
  already enabled, then it is re-enabled. Supported in remote mode only.
  For usage instructions, see link:deploying-applications.html#gijjy[To
  Enable an Application or Module].
link:../reference-manual/get-client-stubs.html#GSRFM00140[`get-client-stubs`]::
  Gets the client stubs JAR file for an application client module or an
  application containing the application client module, from the server
  machine to the local directory. For usage instructions, see
  link:deploying-applications.html#beaek[EJB Module Deployment
```

```
Guidelines].
link:../reference-manual/list-applications.html#GSRFM00148['list-applications']::
  Lists deployed Java EE applications and modules. Optionally lists
  subcomponents and scoped resources. If the '--type' option is not
  specified, all applications and modules are listed. Supported in
  remote mode only. For usage instructions, see
  link:deploying-applications.html#giulr[To List Deployed Applications or
  Modules1.
link:../reference-manual/list-application-refs.html#GSRFM00147['list-application-
refs`]::
  Lists Java EE applications and modules deployed on the specified
  target server instance or cluster.
link:../reference-manual/list-libraries.html#GSRFM00819[`list-libraries`]::
  Lists library JAR files that have been added to GlassFish Server. You
  can specify whether to list libraries in the Common class loader
  directory, the Java optional package directory, or the
  application-specific class loader directory.
link:../reference-manual/list-lifecycle-modules.html#GSRFM00181['list-lifecycle-
modules`]::
  Lists lifecycle modules.
link:../reference-manual/list-components.html#GSRFM00155['list-components']::
  This subcommand is deprecated. Use the 'list-applications' subcommand
  instead.
link:../reference-manual/list-sub-components.html#GSRFM00201['list-sub-components']::
  Lists EJBs or servlets in a deployed module or in a module of the
  deployed application. If a module is not identified, all modules are
  listed. To display a specific module in an application, you must
  specify the module name and the '--appname' option. Supported in
  remote mode only. For usage instructions, see
  link:deploying-applications.html#giulr[To List Deployed Applications or
  Modules1.
link:../reference-manual/list-web-context-param.html#GSRFM00208[`list-web-context-
param']::
  Lists servlet context-initialization parameters of a deployed web
  application or module. Supported in remote mode only. For usage
  instructions, see link:deploying-applications.html#giybo[To List Web
  Context Parameters].
link:../reference-manual/list-web-env-entry.html#GSRFM00209['list-web-env-entry']::
  Lists environment entries for a deployed web application or module.
  Supported in remote mode only. For usage instructions, see
  link:deploying-applications.html#giyip[To List Web Environment
  Entries].
link:../reference-manual/redeploy.html#GSRFM00217[`redeploy`]::
  Overwrites an application or module that is already deployed.
  Supported in remote mode only. For usage instructions, see
  link:deploying-applications.html#gijmb[To Redeploy an Application or
  Module].
link:../reference-manual/remove-library.html#GSRFM00820[`remove-library`]::
```

```
Removes one or more library JAR files from GlassFish Server. You can
  specify whether the libraries are removed from the Common class loader
  directory, the Java optional package directory, or the
  application-specific class loader directory.
link:../reference-manual/set-web-context-param.html#GSRFM00230['set-web-context-
param']::
  Sets a servlet context-initialization parameter of a deployed web
  application or module. Supported in remote mode only. For usage
  instructions, see link:deploying-applications.html#giyce[To Set a Web
  Context Parameter].
link:../reference-manual/set-web-env-entry.html#GSRFM00231['set-web-env-entry']::
  Sets an environment entry for a deployed web application or module.
  Supported in remote mode only. For usage instructions, see
  link:deploying-applications.html#giyhc[To Set a Web Environment Entry].
link:../reference-manual/show-component-status.html#GSRFM00232['show-component-
status'l::
  Shows the status of a deployed component. The possible statuses
  include 'enabled' or 'disabled'. Supported in remote mode only. For
  usage instructions, see link:deploying-applications.html#giulr[To List
  Deployed Applications or Modules].
link:../reference-manual/undeploy.html#GSRFM00244['undeploy']::
  Uninstalls the specified deployed application or module. Supported in
  remote mode only. For usage instructions, see
  link:deploying-applications.html#gijkl[To Undeploy an Application or
  Module1.
link:../reference-manual/unset-web-context-param.html#GSRFM00248[`unset-web-context-
param'l::
  Unsets a servlet context-initialization parameter of a deployed web
  application or module. Supported in remote mode only. For usage
  instructions, see link:deploying-applications.html#giycy[To Unset a Web
  Context Parameter].
link:../reference-manual/unset-web-env-entry.html#GSRFM00249[`unset-web-env-entry`]::
  Unsets an environment entry for a deployed web application or module.
  Supported in remote mode only. For usage instructions, see
  link:deploying-applications.html#giyjr[To Unset a Web Environment
  Entry].

[[b-glassfish-server-deployment-descriptor-files]]
B GlassFish Server Deployment Descriptor Files
This appendix describes the element hierarchies in the GlassFish Server
```

deployment descriptors that are included in this release of the GlassFish Server Open Source Edition software.

The following topics are addressed here:

- * link:#giiie[About the GlassFish Server Deployment Descriptors]
- * link:#beagk[The glassfish-application.xml File]
- * link:#beagl[The glassfish-web.xml File]
- * link:#beaqm[The glassfish-ejb-jar.xml File]
- * link:#beagn[The sun-cmp-mappings.xml File]
- * link:#beago[The glassfish-application-client.xml file]
- * link:#beagp[The sun-acc.xml File]
- * link:#giyhh[The glassfish-resources.xml File]
- * link:#gkiot[WebLogic Server Deployment Descriptor Support in GlassFish Server1

[[qiiie]][[GSDPG00076]][[about-the-glassfish-server-deployment-descriptors]]

About the GlassFish Server Deployment Descriptors

Each deployment descriptor XML file has a corresponding Document Type Definition (DTD) file, which defines the elements, data, and attributes that the deployment descriptor file can contain. For example, the 'qlassfish-application_6_0-1.dtd' file defines the structure of the 'glassfish-application.xml' file. The DTD files for the GlassFish Server deployment descriptors are located in the as-install'/lib/dtds' directory.

The GlassFish Server deployment descriptor files must be readable and writable by the file owners. In each deployment descriptor file, subelements must be defined in the order in which they are listed under each Subelements heading, unless otherwise noted. For general information about DTD files and XML, see the XML specification at `http://www.w3.org/TR/REC-xml`.

ΓN	101	Έ]	

Do not edit the DTD files; their contents change only with new versions of GlassFish Server.

The following table lists the GlassFish Server deployment descriptors and their DTD files.

```
[[GSDPG835]][[sthref6]][[giiht]]
Table B-1 GlassFish Server Deployment Descriptors and DTDs
[width="100%",cols="30%,39%,31%",options="header",]
|-----
|Deployment Descriptor | DTD File | Description
|'glassfish-application.xml' |'glassfish-application_6_0-1.dtd'
|Configures an entire Java EE application (EAR file).
|'glassfish-web.xml' |'glassfish-web-app_3_0-1.dtd' |Configures a web
application (WAR file).
|'glassfish-ejb-jar.xml' |'glassfish-ejb-jar_3_1-1.dtd' |Configures an
enterprise bean (EJB JAR file).
|'sun-cmp-mappings.xml' |'sun-cmp-mapping_1_2.dtd' |Configures
container-managed persistence for an EJB 2.0 or 2.1 entity bean.
|'glassfish-application-client.xml'
|'glassfish-application-client_6_0-1.dtd' |Configures an Application
Client Container (ACC) client (JAR file).
'sun-acc.xml' | 'sun-application-client-container 1 2.dtd' | Configures
the Application Client Container. This is more of a configuration file
than a deployment descriptor. GlassFish Server provides a default file
in the domain-dir'/config' directory. Specifying a different file is
optional.
|'glassfish-resources.xml' |'glassfish-resources_1_5.dtd' |Configures
application-scoped resources.
|-----
[NOTE]
The `sun-application.xml`, `sun-web.xml`, `sun-ejb-jar.xml`,
'sun-application-client.xml', and 'sun-resources.xml' deployment
descriptors are supported for backward compatibility.

[NOTE]
If any configuration information for an enterprise bean is not specified
in the 'glassfish-ejb-jar.xml' file, it defaults to a corresponding
setting in the EJB container if an equivalency exists.
Here is a sample 'glassfish-ejb-jar.xml' file:
[source,oac_no_warn]
<!DOCTYPE glassfish-ejb-jar PUBLIC "-//GlassFish.org//</pre>
DTD GlassFish Application Server 3.1 EJB 3.1//EN"

[[qkiot]][[GSDPG00084]][[weblogic-server-deployment-descriptor-support-in-glassfish-
server]]
WebLogic Server Deployment Descriptor Support in GlassFish Server
GlassFish Server offers limited support for the
'weblogic-application.xml', 'weblogic.xml', and
'weblogic-webservices.xml' deployment descriptor files.
The only element in 'weblogic-application.xml' that GlassFish Server
supports is 'security'. The equivalent element in the
'glassfish-application.xml' file is 'security-role-mapping'.
The elements of 'weblogic.xml' that GlassFish Server supports are
explained in the following table.
[[GSDPG836]][[sthref7]][[gkinm]]
Table B-2 'weblogic.xml' Support in GlassFish Server
[width="100%",cols="43%,57%",options="header",]
|-----
|'weblogic.xml' Element Name |GlassFish Server Support
|'role-name' under 'security-role-assignment' |'role-name' under
`security-role-mapping` `glassfish-web.xml` equivalent
|'principal-name' under 'security-role-assignment' |'principal-name'
under 'security-role-mapping' 'glassfish-web.xml' equivalent
|'resource-description'|'resource-ref' 'glassfish-web.xml' equivalent,
but 'resource-link' not supported
```

```
['resource-env-description' | resource-env-ref' 'glassfish-web.xml'
equivalent, but 'resource-link' not supported
|'ejb-reference-description' |'ejb-ref' 'glassfish-web.xml' equivalent
|'service-reference-description' |'service-ref' 'glassfish-web.xml'
equivalent
|'timeout-secs' under 'session-descriptor' |'timeoutSeconds' property of
`session-properties` `glassfish-web.xml` equivalent
|'invalidation-interval-secs' under 'session-descriptor'
|'reapIntervalSeconds' property of 'manager-properties'
'glassfish-web.xml' equivalent
| 'max-in-memory-sessions' under 'session-descriptor' | 'maxSessions'
property of 'manager-properties' 'glassfish-web.xml' equivalent
|'persistent-store-dir' under 'session-descriptor' |'directory' property
of 'store-properties' 'glassfish-web.xml' equivalent
|'prefer-web-inf-classes' under 'container-descriptor' |'delegate'

|'context-root' |'context-root' 'glassfish-web.xml' equivalent
|'cookies-enabled' under 'session-descriptor' |Servlet 3.0
|'cookie-name' under 'session-descriptor' |Servlet 3.0
|'cookie-path' under 'session-descriptor' |Servlet 3.0
l'cookie-domain' under 'session-descriptor' | Servlet 3.0
|'cookie-comment' under 'session-descriptor' |Servlet 3.0
|'cookie-secure' under 'session-descriptor' |Servlet 3.0
|'cookie-max-age-secs' under 'session-descriptor' |Servlet 3.0
'cookie-http-only' under 'session-descriptor' | Servlet 3.0
|'url-rewriting-enabled' under 'session-descriptor' |Servlet 3.0
|'persistent-store-cookie-name' under 'session-descriptor' |Cookie-based
persistence is supported
|'keepgenerated' under 'jsp-descriptor' |keepgenerated init parameter of
```

```
`JspServlet`
|'working-dir' under 'jsp-descriptor' |scratchdir init parameter of
`JspServlet`
|'compress-html-template' under 'jsp-descriptor' | trimSpaces init
parameter of 'JspServlet'
|'index-directory-enabled' under 'container-descriptor' |listings init
parameter of 'DefaultServlet'
|'index-directory-sort-by' under 'container-descriptor' |sortedBy init
parameter of 'DefaultServlet'
|'save-sessions-enabled' under 'container-descriptor' |Same as
`asadmin redeploy` '--keepstate=true' or 'keep-state' in
`glassfish-web.xml`
|'run-as-principal-name' under 'servlet-descriptor' |'principal-name'
under 'servlet' 'glassfish-web.xml' equivalent
The elements of 'weblogic-webservices.xml' that GlassFish Server
supports are explained in the following table.
[[GSDPG837]][[sthref8]][[gkkht]]
Table B-3 'weblogic-webservices.xml' Support in GlassFish Server
[width="100%",cols="34%,66%",options="header",]
|'weblogic-webservices.xml' Element Name |GlassFish Server Support
|`webservice-type` |Possible values are `JAXRPC` or `JAXWS`. GlassFish
Server does not support JAX-RPC web services with JSR 181 annotations.
The use of this element is limited, because the container can find out
if the type is JAX-WS or JAX-RPC based on presence of JSR 181
annotations.
|`wsdl-publish-file` |Same as `wsdl-publish-location` in
`glassfish-web.xml`
|'service-endpoint-address' |Similar to 'endpoint-address-uri' in
'glassfish-web.xml', except that 'webservice-contextpath' and
'webservice-serviceuri' are specified separately
|'j2ee:login-config' |Same as 'login-config' in 'glassfish-web.xml'
```

```
l'j2ee:transport-guarantee' | Same as 'transport-guarantee' in
`glassfish-web.xml`
|'exposed' under 'wsdl' |Accepts 'true' or 'false', defaults to 'true'.
Controls the publishing of WSDL to clients.
'stream-attachments' |Accepts 'true' or 'false', defaults to 'true'.
Only for JAX-WS web services. Configures the JAX-WS runtime to send
attachments in streaming fashion.
|'validate-request' |Accepts 'true' or 'false', defaults to 'false'.
Only for JAX-WS web services. Configures the JAX-WS runtime to validate
that request messages are as the WSDL definitions specify.
|`http-response-buffersize` |Property of `ReliabilityMessagingFeature`
configuration, similar to
`ReliableMessagingFeature.setDestinationBufferQuota()`
'reliability-config' | Partially supported. Subelements map to Metro's
`ReliabilityMessagingFeature`.
l'inactivity-timeout' under 'reliability-config' | Maps to
`ReliableMessagingFeature.getSequenceInactivityTimeout()`
|'base-retransmission-interval' under 'reliability-config' |Maps to
`ReliableMessagingFeature.``getMessageRetransmissionInterval()`
|'retransmission-exponential-''backoff' under 'reliability-config' |Maps
to `ReliableMessagingFeature.``getRetransmissionBackoffAlgorithm()`.
Returns enum values, one of them is 'exponential'.
|'acknowledgement-interval' under 'reliability-config' |Maps to
`ReliableMessagingFeature.``getAcknowledgementTransmissionInterval()`
'sequence-expiration' under 'reliability-config' | Maps to
`ReliableMessagingFeature.``getSequenceInactivityTimeout()`. In WebLogic
Server this value applies regardless of activity. In Metro it applies
only to inactive sequences.
|'buffer-retry-count' under 'reliability-config' | Maps to
`ReliableMessagingFeature.``getMaxMessageRetransmissionCount()`
|'buffer-retry-delay' under 'reliability-config' |Maps to
`ReliableMessagingFeature.``getMessageRetransmissionInterval()`
|-----
```

'Attributes'
\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda
The following table describes attributes for the 'auth-realm' element.
[[GSDPG848]][[sthref21]][[fvypa]]
Table C-7 'auth-realm' attributes
[width="100%",cols="18%,13%,69%",options="header",]
|-----
|Attribute | Default | Description
|'name' |none |Defines the name of this realm.
|'classname' |none |Defines the Java class which implements this realm.
[[fvyox]][[GSDPG00352]][[example]]
Example
\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda\Lambda
Here is an example of the default file realm:
[source,oac no warn]
<auth-realm name="file"
  classname="com.sun.enterprise.security.auth.realm.file.FileRealm">
  <property name="file" value="domain-dir/config/keyfile"/>
  <property name="jaas-context" value="fileRealm"/>
</auth-realm>
```

```
Which properties an 'auth-realm' element uses depends on the value of
the 'auth-realm' element's 'name' attribute. The file realm uses 'file'
and 'jaas-context' properties. Other realms use different properties.
See "link:../application-development-guide/securing-apps.html#GSDVG00118[Realm
Configuration]" in GlassFish Server Open
Source Edition Application Development Guide.
[[giyjv]][[GSDPG00094]][[backend-principal]]

[[bearn]][[GSDPG00107]][[check-version-of-accessed-instances]]
`check-version-of-accessed-instances`
Checks the version column of the modified beans.
Version consistency allows the bean state to be cached between
transactions instead of read from a database. The bean state is verified
by primary key and version column values. This occurs during a custom
query (for dirty instances only) or commit (for both clean and dirty
instances).
The version column must be a numeric type, and must be in the primary
table. You must provide appropriate update triggers for this column.

Table C-23 'class-loader' Attributes
[width="172%",cols="17%,46%,37%",options="header",]
|-----
|Attribute | Default | Description
|'extra-class-path' |null a|
(optional) Specifies a colon or semicolon separated list of additional
classpaths for this web module. Paths can be absolute or relative to the
web module's root, for example:
[source,oac_no_warn]
extra-class-path="WEB-INF/lib/extra/extra.jar"
|'delegate' |'true' a|
(optional) If 'true', the web module follows the standard class loader
delegation model and delegates to its parent class loader first before
```

looking in the local class loader. You must set this to 'true' for a web module that accesses EJB components or that acts as a web service client or endpoint.

If 'false', the web module follows the delegation model specified in the Servlet specification and looks in its class loader before looking in the parent class loader. It's safe to set this to 'false' only for a web module that does not interact with any other modules.

For a number of packages, including 'java.*' and 'javax.*', symbol resolution is always delegated to the parent class loader regardless of the delegate setting. This prevents applications from overriding core Java runtime classes or changing the API versions of specifications that are part of the Java EE platform.

|'dynamic-reload-''interval' | + |(optional) Not implemented. Included for backward compatibility with previous Oracle Web Server versions. |-----

[NOTE]

If the 'delegate' attribute is set to 'false', the class loader delegation behavior complies with the Servlet 2.4 specification, section 9.7.2. If set to its default value of 'true', classes and resources residing in container-wide library JAR files are loaded in preference to classes and resources packaged within the WAR file.

Portable programs that use this element should not be packaged with any classes or interfaces that are a part of the Java EE specification. The behavior of a program that includes such classes or interfaces in its WAR file is undefined.

Attributes ^^^

The following table describes attributes for the connector-connection-pool element. Changing the following attributes requires a server restart or the redeployment or disabling and re-enabling of applications that refer to the resource: resource-adapter-name, connection-definition-name, transaction-support, associate-with-thread, lazy-connection-association, and lazy-connectionenlistment.

Table C-36 connector-connection-pool Attributes

Attribute	Default	Description
name	none	Specifies the name of the connection pool. A connector-resource element's pool-name attribute refers to this name.

Attribute	Default	Description
resource-adapter-name	none	Specifies the name of the deployed connector module or application. If no name is specified during deployment, the name of the .rar file is used. If the resource adapter is embedded in an application, then it is app_name`#`rar_name.
connection-definition -name	none	Specifies a unique name, identifying a resource adapter's connection-definition element in the ra.xml file. This is usually the connectionfactory-interface of the connection-definition element.
steady-pool'-size`	8	(optional) Specifies the initial and minimum number of connections maintained in the pool.
max-pool-size	32	(optional) Specifies the maximum number of connections that can be created to satisfy client requests.
<pre>max-wait-time-in` -millis`</pre>	60000	(optional) Specifies the amount of time, in milliseconds, that the caller is willing to wait for a connection. If 0, the caller is blocked indefinitely until a resource is available or an error occurs.

Attribute	Default	Description
pool-resize`-quantity`	2	(optional) Specifies the number of idle connections to be destroyed if the existing number of connections is above the steady-pool-size (subject to the max-pool-size limit). This is enforced periodically at the idletimeout-in-seconds interval. An idle connection is one that has not been used for a period of idle-timeout-in-seconds. When the pool size reaches steady-pool-size, connection removal stops.
<pre>idle-timeout'-in -seconds`</pre>	300	(optional) Specifies the maximum time that a connection can remain idle in the pool. After this amount of time, the pool can close this connection.
fail-all-``connections	false	(optional) If true, closes all connections in the pool if a single validation check fails.

Attribute	Default	Description
transaction`-support`	none	(optional) Specifies the transaction support for this connection pool. Overrides the transaction support defined in the resource adapter in a downward compatible way: supports a transaction level lower than or equal to the resource adapter's, but not higher. Allowed values in descending order are: • XATransaction - Supports distributed transactions. • LocalTransaction - Supports local transactions only. • NoTransaction - No transaction support.
is-connection- validation-required	false	(optional) Specifies whether connections have to be validated before being given to the application. If a resource's validation fails, it is destroyed, and a new resource is created and returned.
validate-atmost-once- ``period-in-seconds	0	Specifies the time interval within which a connection is validated at most once. Minimizes the number of validation calls. A value of zero allows unlimited validation calls.

Attribute	Default	Description
connection-leak- timeout-in-seconds	0	Detects potential connection leaks by the application. A connection that is not returned back to the pool by the application within the specified period is assumed to be potentially leaking, and a stack trace of the caller is logged. A zero value disables leak detection. A nonzero value enables leak tracing.
connection-leak- ``reclaim	false	If true, the pool will reclaim a connection after connection-leak-timeout-in-seconds occurs.
connection-creation- ``retry-attempts	0	Specifies the number of attempts to create a new connection.
connection-creation-retry-interval-in-seconds	10	Specifies the time interval between attempts to create a connection when connection-creation-retryattempts is greater than 0.
lazy-connection- ``enlistment	false	If true, a connection is not enlisted in a transaction until it is used. If false, any connection object available to a transaction is enlisted in the transaction.
lazy-connection- ``association	false	If true, a physical connection is not associated with a logical connection until it is used. If false, a physical connection is associated with a logical connection even before it is used.

Attribute	Default	Description
associate-with-thread	false	If true, allows connections to be saved as ThreadLocal in the calling thread. Connections get reclaimed only when the calling thread dies or when the calling thread is not in use and the pool has run out of connections. If false, the thread must obtain a connection from the pool each time the thread requires a connection.
		This attribute associates connections with a thread such that when the same thread is in need of connections, it can reuse the connections already associated with that thread. In this case, the overhead of getting connections from the pool is avoided. However, when this value is set to true, you should verify that the value of the max-pool-size attribute is comparable to the max-thread-pool-size attribute of the associated thread pool. If the max-thread-pool-size value is much higher than the max-pool-size value, a lot of time is spent associating connections with a new thread after dissociating them from an older one. Use this attribute in cases
		where the thread pool should reuse connections to avoid this overhead.

Attribute	Default	Description
match-connections	true	If true, enables connection matching. You can set to false if connections are homogeneous.
max-connection- ``usage-count	0	Specifies the number of times a connections is reused by the pool, after which it is closed. A zero value disables this feature.
ping	false	(optional) Specifies whether to ping the pool during pool creation or reconfiguration to identify and warn of any erroneous attribute values.
pooling	true	(optional) If false, disables connection pooling.

Properties ^^^

Most properties of the connector-connection-pool element are the names of setter methods of the managedconnectionfactory-class element in the ra.xml file. Properties of the connector-connectionpool element override the ManagedConnectionFactory JavaBean configuration settings.

All but the last four properties in the following table are connector-connection-pool properties of jmsra, the resource adapter used to communicate with the Open Message Queue software. For a complete list of the available properties (called administered object attributes in the Message Queue software), see the Open Message Queue Administration Guide.

Changes to connector-connection-pool properties require a server restart.

Table C-37 connector-connection-pool Properties

Property	Default	Description
AddressList	none	Specifies a list of host/port combinations of the Message Queue software. For JMS resources of the Type jakarta.jms.TopicConnectionFactory or jakarta.jms.QueueConnectionFactory.

Property	Default	Description
ClientId	none	Specifies the JMS Client Identifier to be associated with a Connection created using the createTopicConnection method of the TopicConnectionFactory class. For JMS resources of the Type jakarta.jms.TopicConnectionFactory. Durable subscription names are unique and only valid within the scope of a client identifier. To create or reactivate a durable subscriber, the connection must have a valid client identifier. The JMS specification ensures that client identifiers are unique and that a given client identifier is allowed to be used by only one active connection at a time.
UserName	guest	Specifies the user name for connecting to the Message Queue software. For JMS resources of the Type jakarta.jms.TopicConnectionFactory or jakarta.jms.QueueConnectionFactory.
Password	guest	Specifies the password for connecting to the Message Queue software. For JMS resources of the Type jakarta.jms.TopicConnectionFactory or jakarta.jms.QueueConnectionFactory.
ReconnectAttempts	6	Specifies the number of attempts to connect (or reconnect) for each address in the <code>imqAddressList</code> before the client runtime moves on to try the next address in the list. A value of -1 indicates that the number of reconnect attempts is unlimited (the client runtime attempts to connect to the first address until it succeeds).
ReconnectInterval	30000	Specifies the interval between reconnect attempts in milliseconds. This applies to attempts on each address in the imqAddressList and on successive addresses in the list. If too short, this time interval does not give a broker time to recover. If too long, the reconnect might represent an unacceptable delay.
ReconnectEnabled	false	If true, specifies that the client runtime attempts to reconnect to a message server (or the list of addresses in imqAddressList) when a connection is lost.
AddressListBehavior	priority	Specifies whether connection attempts are in the order of addresses in the imqAddressList attribute (priority) or in a random order (random). If many clients are attempting a connection using the same connection factory, use a random order to prevent them from all being connected to the same address.

Property	Default	Description
AddressListIterations	-1	Specifies the number of times the client runtime iterates through the <pre>imqAddressList</pre> in an effort to establish (or reestablish) a connection. A value of -1 indicates that the number of attempts is unlimited.

All JMS administered object resource properties that worked with version 7 of the GlassFish Server are supported for backward compatibility.

connector-resource ~~~~~

Defines the connection factory object of a specific connection definition in a connector (resource adapter).

Superelements ^^^^

resources (glassfish-resources.xml)

Subelements ^^^^

The following table describes subelements for the connector-resource element.

Table C-38 connector-resource Subelements

Element	Required	Description
description	zero or one	Contains a text description of this element.
property (with attributes)	zero or more	Specifies a property or a variable.

Attributes ^^^

The following table describes attributes for the connector-resource element.

Table C-39 connector-resource Attributes

Attrib ute	Default	Description
jndi- name	none	Specifies the JNDI name for the resource.
pool- name	none	Specifies the name of the associated connector-connection-pool.
object- type	user	 (optional) Defines the type of the resource. Allowed values are: system-all - A system resource for all server instances and the domain application server. system-admin - A system resource only for the domain application server. system-instance - A system resource for all server instances only. user - A user resource.
enabled	true	(optional) Determines whether this resource is enabled at runtime.

consistency ~~~~~

Specifies container behavior in guaranteeing transactional consistency of the data in the bean.

Superelements ^^^^

entity-mapping (sun-cmp-mappings.xml)

Subelements ^^^^

The following table describes subelements for the consistency element.

Table C-40 consistency Subelements

Element	Required	Description
none	exactly one subelement is required	No consistency checking occurs.
check-modified-at-commit	exactly one subelement is required	Checks concurrent modification of fields in modified beans at commit time.
lock-when-loaded	exactly one subelement is required	Obtains an exclusive lock when the data is loaded.
check-all-at-commit	+	This element is not implemented. Do not use.
lock-when-modified	+	This element is not implemented. Do not use.
check-version-of-accessed- instances	exactly one subelement is required	Checks the version column of the modified beans.

constraint-field

Specifies a cacheability constraint for the given url-pattern or servlet-name.

All constraint-field constraints must pass for a response to be cached. If there are value constraints, at least one of them must pass.

Superelements ^^^^

cache-mapping (glassfish-web.xml)

Subelements ^^^^

The following table describes subelements for the constraint-field element.

Table C-41 constraint-field Subelements

Element	Required	Description
constraint-field-value	zero or more	Contains a value to be matched to the input parameter value.

Attributes ^^^

The following table describes attributes for the constraint-field element.

Table C-42 constraint-field Attributes

Attribute	Default	Description
name	none	Specifies the input parameter name.
scope	request.parameter	(optional) Specifies the scope from which the input parameter is retrieved. Allowed values are context.attribute, request.header, request.parameter, request.cookie, request.attribute, and session.attribute.
cache-on-match	true	(optional) If true, caches the response if matching succeeds. Overrides the same attribute in a constraint-field-value subelement.
cache-on-match` -failure`	false	(optional) If true, caches the response if matching fails. Overrides the same attribute in a constraint-field-value subelement.

constraint-field-value

Specifies a value to be matched to the input parameter value. The matching is case sensitive. For example:

<value match-expr="in-range">1-60</value>

Superelements $^{^{\wedge\wedge\wedge\wedge}\wedge}$

constraint-field (glassfish-web.xml)

Subelements ^^^^

none - contains data

Attributes ^^^

The following table describes attributes for the constraint-field-value element.

Table C-43 constraint-field-value Attributes

Attribut e	Default	Description
match- expr	equals	(optional) Specifies the type of comparison performed with the value. Allowed values are equals, not-equals, greater, lesser, and in-range. If match-expr is greater or lesser, the value must be a number. If match-expr is in-range, the value must be of the form n1`-`n2, where n1 and n2 are numbers.
cache-on- match	true	(optional) If true, caches the response if matching succeeds.
cache-on- match`-fai lure`		(optional) If true, caches the response if matching fails.

context-root ~~~~

Contains the web context root for the application or web application that was packaged as a WAR file. Overrides the corresponding element in the application.xml or web.xml file.

If the parent element is <code>java-web-start-access</code>, this element contains the context root for the Java Web Start enabled application client module. If none is specified, a default is generated; see <code>java-web-start-access</code>.

If you are setting up load balancing, web module context roots must be unique within a server instance. See the GlassFish Server Open Source Edition High Availability Administration Guide for more information about load balancing.

Superelements ^^^^

web (glassfish-application.xml), glassfish-web-app (glassfish-web.xml), java-web-start-access
(glassfish-application-client.xml)

Subelements ^^^^

none - contains data

cookie-properties ~~~~~~~

Specifies session cookie properties.

If cookie settings are defined declaratively in the web.xml file, the cookie properties defined here take precedence. If cookie settings are defined programmatically using javax.servlet.SessionCookieConfig methods, those cookie settings take precedence over the cookie properties defined here.

Superelements ^^^^

session-config (glassfish-web.xml)

Subelements ^^^^

The following table describes subelements for the cookie-properties element.

Table C-44 cookie-properties Subelements

Element	Required	Description
property (with attributes)	zero or more	Specifies a property, which has a name and a value.

Properties ^^^

The following table describes properties for the cookie-properties element.

Table C-45 cookie-properties Properties

Property	Default	Description
cookieName	none	Specifies the cookie name.
cookiePath	Context path at which the web module is installed.	Specifies the pathname that is set when the cookie is created. The browser sends the cookie if the pathname for the request contains this pathname. If set to / (slash), the browser sends cookies to all URLs served by GlassFish Server. You can set the path to a narrower mapping to limit the request URLs to which the browser sends cookies.
cookieMaxAgeSeconds	none	Specifies the expiration time (in seconds) after which the browser expires the cookie. If this is unset, the cookie doesn't expire.
cookieDomain	(unset)	Specifies the domain for which the cookie is valid.
cookieComment	none	Specifies the comment that identifies the session tracking cookie in the cookie file.
cookieSecure	dynamic	 Sets the Secure attribute of any JSESSIONID cookies associated with the web application. Allowed values are as follows: true — Sets Secure to true. false — Sets Secure to false. dynamic — The JSESSIONID cookie inherits the Secure setting of the request that initiated the session. To set the Secure attribute of a JSESSIONIDSSO cookie, use the ssoCookieSecure virtual-server property. For details, see create-virtual-server(1).
cookieHttpOnly	none	Specifies that the cookie is marked HTTP only. Allowed values are true or false.

create-tables-at-deploy ~~~~~~

Specifies whether database tables are created for beans that are automatically mapped by the EJB container. If true, creates tables in the database. If false (the default if this element is not present), does not create tables.

This element can be overridden during deployment. See "Generation Options for CMP" in GlassFish Server Open Source Edition Application Development Guide.

```
Superelements ^{^{\wedge\wedge\wedge\wedge}\wedge}
```

cmp-resource(glassfish-ejb-jar.xml)

Subelements ^^^^

none - contains data

custom-resource ~~~~

Defines a custom resource, which specifies a custom server-wide resource object factory. Such object factories implement the javax.naming.spi.ObjectFactory interface.

Superelements ^^^^

resources (glassfish-resources.xml)

Subelements ^^^

The following table describes subelements for the custom-resource element.

Table C-46 custom-resource Subelements

Element	Required	Description
description	zero or one	Contains a text description of this element.
property (with attributes)	zero or more	Specifies a property or a variable.

Attributes ^^^

The following table describes attributes for the custom-resource element.

Table C-47 custom-resource Attributes

Attribut e	Default	Description
jndi-name	none	Specifies the JNDI name for the resource.
res-type	none	Specifies the fully qualified type of the resource.
factory- class	none	Specifies the fully qualified name of the user-written factory class, which implements javax.naming.spi.ObjectFactory.
object- type	USET	 (optional) Defines the type of the resource. Allowed values are: system-all - A system resource for all server instances and the domain application server. system-admin - A system resource only for the domain application server. system-instance - A system resource for all server instances only. user - A user resource.
enabled	true	(optional) Determines whether this resource is enabled at runtime.

database-vendor-name~

Specifies the name of the database vendor for which tables can be created. Allowed values are javadb, db2, mssql, mysql, oracle, postgresql, pointbase, derby (also for CloudScape), and sybase, caseinsensitive.

If no value is specified, a connection is made to the resource specified by the jndi-name subelement of the cmp-resource element, and the database vendor name is read. If the connection cannot be established, or if the value is not recognized, SQL-92 compliance is presumed.

This element can be overridden during deployment. See "Generation Options for CMP" in GlassFish Server Open Source Edition Application Development Guide.

Superelements ^^^^

```
cmp-resource (glassfish-ejb-jar.xml)
Subelements ^^^^
none - contains data
debugging-enabled ....~
Specifies whether the debugging servlet is enabled for this web service endpoint. Allowed values
are true (the default) and false.
Superelements ^^^^
webservice-endpoint (glassfish-web.xml, glassfish-ejb-jar.xml)
Subelements ^^^^^
none - contains data
default ....
Specifies that a field belongs to the default hierarchical fetch group, and enables prefetching for a
CMR field. To disable prefetching for specific query methods, use a prefetch-disabled element in
the glassfish-ejb-jar.xml file.
Superelements ^{\wedge\wedge\wedge\wedge}\wedge
fetched-with (sun-cmp-mappings.xml)
Subelements ^^^^
none - element is present or absent
default-helper ....~
```

Passes property values to the built-in default cache-helper class.

Superelements ^^^^

cache (glassfish-web.xml)

Subelements ^^^^

The following table describes subelements for the default-helper element.

Table C-48 default-helper Subelements

Element	Required	Description
property (with attributes)	zero or more	Specifies a property, which has a name and a value.

Properties ^^^

The following table describes properties for the default-helper element.

Table C-49 default-helper Properties

Property	Default	Description
cacheKeyGeneratorAttrName	Uses the built-in default cache-helper key generation, which concatenates the servlet path with key-field values, if any.	The caching engine looks in the ServletContext for an attribute with a name equal to the value specified for this property to determine whether a customized CacheKeyGenerator implementation is used. An application can provide a customized key generator rather than using the default helper. See "The CacheKeyGenerator Interface" in GlassFish Server Open Source Edition Application Development Guide.

default-resource-principal~

Specifies the default principal (user) for the resource.

If this element is used in conjunction with a JMS Connection Factory resource, the name and password subelements must be valid entries in the Open Message Queue broker user repository. See "Configuring and Managing Security Services" in Open Message Queue Administration Guide for details.

Superelements ^^^^

resource-ref (glassfish-web.xml, glassfish-ejb-jar.xml, glassfish-application-client.xml); cmpresource, mdb-connection-factory (glassfish-ejb-jar.xml)

Subelements ^^^^

The following table describes subelements for the default-resource-principal element.

Table C-50 default-resource-principal Subelements

Element	Require d	Description
name	only one	Specifies the default resource principal name used to sign on to a resource manager.
password	only one	Specifies password of the default resource principal.

description~

Specifies a text description of the containing element.

Superelements ^^^^

property (with attributes), valve (glassfish-web.xml); activation-config, method (glassfish-ejb-(sun-acc.xml); admin-object-resource, connector-connection-pool, jar.xml); target-server connector-resource, custom-resource, external-jndi-resource, jdbc-connection-pool, jdbc-resource, mail-resource, property (with attributes), resource-adapter-config (glassfish-resources.xml)

```
Subelements ^^^^
none - contains data

disable-nonportable-jndi-names ~~~
```

Because the EJB 3.1 specification defines portable EJB JNDI names, there is less need for GlassFish Server specific JNDI names. By default, GlassFish Server specific default JNDI names are applied automatically for backward compatibility. To disable GlassFish Server specific JNDI names for an EJB module, set the value of this element to true. The default is false.

```
Superelements ^^^^
glassfish-ejb-jar (glassfish-ejb-jar.xml)
Subelements ^^^^^
none - contains data
```

dispatcher

Specifies a comma-separated list of RequestDispatcher methods for which caching is enabled on the target resource. Valid values are REQUEST, FORWARD, INCLUDE, and ERROR. If this element is not specified, the default is REQUEST. See SRV.6.2.5 of the Servlet 2.4 specification for more information.

```
Superelements ^^^^\
cache-mapping (glassfish-web.xml)

Subelements ^^^^\
none - contains data

drop-tables-at-undeploy ~~~~~
```

Specifies whether database tables that were automatically created when the bean(s) were last

deployed are dropped when the bean(s) are undeployed. If true, drops tables from the database. If false (the default if this element is not present), does not drop tables.

This element can be overridden during deployment. See "Generation Options for CMP" in GlassFish Server Open Source Edition Application Development Guide.

```
Superelements ^^^^
cmp-resource(glassfish-ejb-jar.xml)
Subelements ^^^^
none - contains data
ejb ~~~
```

Defines runtime properties for a single enterprise bean within the application. The subelements listed below apply to particular enterprise beans as follows:

- All types of beans: ejb-name, ejb-ref, resource-ref, resource-env-ref, ior-security-config, genclasses, jndi-name, use-thread-pool-id, message-destination-ref, pass-by-reference, service-ref
- Stateless session beans: bean-pool, webservice-endpoint
- Stateful session beans: bean-cache, webservice-endpoint, checkpoint-at-end-of-method
- Entity beans: commit-option, bean-cache, bean-pool, cmp, is-read-only-bean, refresh-period-inseconds, flush-at-end-of-method
- Message-driven beans: mdb-resource-adapter, mdb-connection-factory, jms-durablesubscription-name, jms-max-messages-load, bean-pool

```
Superelements ^^^^
enterprise-beans (glassfish-ejb-jar.xml)
Subelements ^^^^
```

The following table describes subelements for the ejb element.

Table C-51 ejb Subelements

Element	Required	Description
ejb-name	only one	Matches the ejb-name in the corresponding ejb-jar.xml file.
jndi-name	zero or more	Specifies the absolute jndi-name.
ejb-ref	zero or more	Maps the absolute JNDI name to the ejb-ref element in the corresponding Java EE XML file.
resource-ref	zero or more	Maps the absolute JNDI name to the resource-ref in the corresponding Java EE XML file.
resource-env-ref	zero or more	Maps the absolute JNDI name to the resource-env- ref in the corresponding Java EE XML file.
service-ref	zero or more	Specifies runtime settings for a web service reference.
message-destination-ref	zero or more	Specifies the name of a physical message destination.
pass-by-reference	zero or one	Specifies the passing method used by an enterprise bean calling a remote interface method in another bean that is colocated within the same process.
стр	zero or one	Specifies runtime information for a container-managed persistence (CMP) entity bean for EJB 1.1 and EJB 2.1 beans.
principal	zero or one	Specifies the principal (user) name in an enterprise bean that has the run-as role specified.
mdb-connection-factory	zero or one	Specifies the connection factory associated with a message-driven bean.
jms-durable-subscription-name	zero or one	Specifies the durable subscription associated with a message-driven bean.
jms-max-messages-load	zero or one	Specifies the maximum number of messages to load into a Java Message Service session at one time for a message-driven bean to serve. The default is 1.
ior-security-config	zero or one	Specifies the security information for the IOR.
is-read-only-bean	zero or one	Specifies that this entity bean is read-only.
refresh-period-in-seconds	zero or one	Specifies the rate at which a read-only-bean must be refreshed from the data source.
commit-option	zero or one	Has valid values of B or C. Default value is B.

Element	Required	Description
cmt-timeout-in-seconds	zero or one	Overrides the Transaction Timeout setting of the Transaction Service for an individual bean.
use-thread-pool-id	zero or one	Specifies the thread pool from which threads are selected for remote invocations of this bean.
gen-classes	zero or one	Specifies all the generated class names for a bean.
bean-pool	zero or one	Specifies the bean pool properties. Used for stateless session beans, entity beans, and message-driven beans.
bean-cache	zero or one	Specifies the bean cache properties. Used only for stateful session beans and entity beans.
mdb-resource-adapter	zero or one	Specifies runtime configuration information for a message-driven bean.
webservice-endpoint	zero or more	Specifies information about a web service endpoint.
flush-at-end-of-method	zero or one	Specifies the methods that force a database flush after execution. Used for entity beans.
checkpointed-methods	zero or one	Deprecated. Supported for backward compatibility. Use checkpoint-at-end-of-method instead.
checkpoint-at-end-of-method	zero or one	Specifies that the stateful session bean state is checkpointed, or persisted, after the specified methods are executed. The availability-enabled attribute must be set to true.
per-request-load-balancing	zero or one	Specifies the per-request load balancing behavior of EJB 2.x and 3.x remote client invocations on a stateless session bean.

Attributes ^^^

The following table describes attributes for the ejb element.

Table C-52 ejb Attributes

Attribute	Default	Description
availability- enabled	false	(optional) If set to true, and if availability is enabled in the EJB container, high-availability features apply to this bean if it is a stateful session bean.

Example ^^^

```
<ejb>
   <ejb-name>CustomerEJB</ejb-name>
   <jndi-name>customer</jndi-name>
   <resource-ref>
      <res-ref-name>jdbc/SimpleBank</res-ref-name>
      <jndi-name>jdbc/__default</jndi-name>
   </resource-ref>
   <is-read-only-bean>false</is-read-only-bean>
   <commit-option>B</commit-option>
   <bean-pool>
      <steady-pool-size>10</steady-pool-size>
      <resize-quantity>10</resize-quantity>
      <max-pool-size>100</max-pool-size>
      <pool-idle-timeout-in-seconds>600</pool-idle-timeout-in-seconds>
   </bean-pool>
   <bean-cache>
      <max-cache-size>100</max-cache-size>
      <resize-quantity>10</resize-quantity>
      <removal-timeout-in-seconds>3600</removal-timeout-in-seconds>
      <victim-selection-policy>LRU</victim-selection-policy>
   </bean-cache>
</ejb>
```

ejb-name ...~

In the glassfish-ejb-jar.xml file, matches the ejb-name in the corresponding ejb-jar.xml file. The name must be unique among the names of the enterprise beans in the same EJB JAR file.

There is no architected relationship between the ejb-name in the deployment descriptor and the JNDI name that the deployer assigns to the EJB component's home.

In the sun-cmp-mappings.xml file, specifies the ejb-name of the entity bean in the ejb-jar.xml file to which the container-managed persistence (CMP) bean corresponds.

```
Superelements ^^^^
```

ejb, method (glassfish-ejb-jar.xml); entity-mapping (sun-cmp-mappings.xml)

Subelements ^^^^

none - contains data

ejb-ref

Maps the ejb-ref-name in the corresponding Java EE deployment descriptor file ejb-ref entry to the absolute indi-name of a resource.

The ejb-ref element is used for the declaration of a reference to an EJB's home. Applies to session beans or entity beans.

Superelements ^^^^

glassfish-web-app (glassfish-web.xml), ejb (glassfish-ejb-jar.xml), glassfish-application-client (glassfish-application-client.xml)

Subelements ^^^^

The following table describes subelements for the ejb-ref element.

Table C-53 ejb-ref Subelements

Element	Require d	Description
ejb-ref-name	only one	Specifies the ejb-ref-name in the corresponding Java EE deployment descriptor file ejb-ref entry.
jndi-name	only one	Specifies the absolute jndi-name of a resource.

ejb-ref-name ~~~~

Specifies the ejb-ref-name in the corresponding Java EE deployment descriptor file ejb-ref entry.

```
Superelements ^^^^
ejb-ref(glassfish-web.xml, glassfish-ejb-jar.xml, glassfish-application-client.xml)
Subelements ^^^^
none - contains data
eligible ....~
```

Specifies whether the application client module is eligible to be Java Web Start enabled. Allowed values are true (the default) and false.

```
Superelements ^^^^
java-web-start-access (glassfish-application-client.xml)
Subelements ^^^^
none - contains data
```

endpoint-address-uri ~~~~~~

Specifies the relative path combined with the web server root to form the fully qualified endpoint address for a web service endpoint. This is a required element for EJB endpoints and an optional element for servlet endpoints.

For servlet endpoints, this value is relative to the web application context root. For EJB endpoints, the URI is relative to root of the web server (the first portion of the URI is a context root). The context root portion must not conflict with the context root of any web application deployed to the same web server.

In all cases, this value must be a fixed pattern (no "`*' allowed).

If the web service endpoint is a servlet that implements only a single endpoint and has only one

```
url-pattern, it is not necessary to set this value, because the web container derives it from the
web.xml file.
Superelements ^^^^
webservice-endpoint (glassfish-web.xml, glassfish-ejb-jar.xml)
Subelements ^^^^
none - contains data
Example ^^^
If the web server is listening at http://localhost:8080, the following endpoint-address-uri:
  <endpoint-address-uri>StockQuoteService/StockQuotePort</endpoint-address-uri>
results in the following target endpoint address:
  http://localhost:8080/StockQuoteService/StockQuotePort
enterprise-beans .....
Specifies all the runtime properties for an EJB JAR file in the application.
Superelements ^^^^
glassfish-ejb-jar(glassfish-ejb-jar.xml)
Subelements ^^^^
The following table describes subelements for the enterprise-beans element.
```

Table C-54 enterprise-beans Subelements

Element	Required	Description
name	zero or one	Specifies the name string.
unique-id	zero or one	Specifies a unique system identifier. This data is automatically generated and updated at deployment/redeployment. Do not specify or edit this value.
ejb	zero or more	Defines runtime properties for a single enterprise bean within the application.
pm-descriptors	zero or one	Deprecated.
cmp-resource	zero or one	Specifies the database to be used for storing container- managed persistence (CMP) beans in an EJB JAR file.
message-destination	zero or more	Specifies the name of a logical message destination.
webservice-description	zero or more	Specifies a name and optional publish location for a web service.
property (with subelements)	zero or more	Specifies a property or a variable.

Example ^^^

```
<enterprise-beans>
<ejb>
     <ejb-name>CustomerEJB</ejb-name>
     <jndi-name>customer</jndi-name>
     <resource-ref>
         <res-ref-name>jdbc/SimpleBank</res-ref-name>
         <jndi-name>jdbc/__default</jndi-name>
     </resource-ref>
     <is-read-only-bean>false</is-read-only-bean>
     <commit-option>B</commit-option>
     <bean-pool>
         <steady-pool-size>10</steady-pool-size>
        <resize-quantity>10</resize-quantity>
         <max-pool-size>100</max-pool-size>
         <pool-idle-timeout-in-seconds>600</pool-idle-timeout-in-seconds>
     </bean-pool>
     <bean-cache>
         <max-cache-size>100</max-cache-size>
         <resize-quantity>10</resize-quantity>
         <removal-timeout-in-seconds>3600</removal-timeout-in-seconds>
         <victim-selection-policy>LRU</victim-selection-policy>
     </bean-cache>
</ejb>
</enterprise-beans>
```

```
entity-mapping ~~~~~
```

Specifies the mapping a bean to database columns.

```
Superelements ^^^^
```

sun-cmp-mapping (sun-cmp-mappings.xml)

Subelements ^^^^

The following table describes subelements for the entity-mapping element.

Table C-55 entity-mapping Subelements

Element	Required	Description
ejb-name	only one	Specifies the name of the entity bean in the ejb-jar.xml file to which the CMP bean corresponds.
table-name	only one	Specifies the name of a database table. The table must be present in the database schema file.
cmp-field-mapping	one or more	Associates a field with one or more columns to which it maps.
cmr-field-mapping	zero or more	A container-managed relationship field has a name and one or more column pairs that define the relationship.
secondary-table	zero or more	Describes the relationship between a bean's primary and secondary table.
consistency	zero or one	Specifies container behavior in guaranteeing transactional consistency of the data in the bean.

establish-trust-in-client

Specifies if the target is capable of authenticating a client. The values are NONE, SUPPORTED, or REQUIRED.

Superelements ^^^^

transport-config(glassfish-ejb-jar.xml)

Subelements ^^^^

none - contains data

establish-trust-in-target

Specifies if the target is capable of authenticating to a client. The values are NONE, SUPPORTED, or REQUIRED.

Superelements ^^^^

transport-config (glassfish-ejb-jar.xml)

Subelements ^^^^^

none - contains data

external-jndi-resource

Defines a resource that resides in an external JNDI repository. For example, a generic Java object could be stored in an LDAP server. An external JNDI factory must implement the javax.naming.spi.InitialContextFactory interface.

Superelements ^^^^

resources (glassfish-resources.xml)

Subelements ^^^^

The following table describes subelements for the external-jndi-resource element.

Table C-56 external-jndi-resource Subelements

Element	Required	Description
description	zero or one	Contains a text description of this element.
property (with attributes)	zero or more	Specifies a property or a variable.

Attributes ^^^

The following table describes attributes for the external-jndi-resource element.

Table C-57 external-jndi-resource Attributes

Attribute	Default	Description
jndi-name	none	Specifies the JNDI name for the resource.

Attribute	Default	Description
jndi- lookup-name	none	Specifies the JNDI lookup name for the resource.
res-type	none	Specifies the fully qualified type of the resource.
factory- class	none	Specifies the fully qualified name of the factory class, which implements javax.naming.spi.InitialContextFactory For more information about JNDI, see the GlassFish Server Open Source Edition Application Development Guide.
object-type	user	 (optional) Defines the type of the resource. Allowed values are: system-all - A system resource for all server instances and the domain application server. system-admin - A system resource only for the domain application server. system-instance - A system resource for all server instances only. user - A user resource.
enabled	true	(optional) Determines whether this resource is enabled at runtime.

fetched-with ~~~~

Specifies the fetch group configuration for fields and relationships. The fetched-with element has different allowed and default subelements based on its parent element and the data types of the fields.

• If there is no fetched-with subelement of a cmp-field-mapping, and the data type is not BLOB, CLOB, VARBINARY, LONGVARBINARY, or OTHER, fetched-with can have any valid subelement. The default subelement is as follows:

<fetched-with><default/></fetched-with>

• If there is no fetched-with subelement of a cmp-field-mapping, and the data type is BLOB, CLOB, VARBINARY, LONGVARBINARY, or OTHER, fetched-with can have any valid subelement except <default/>. The default subelement is as follows:

```
<fetched-with><none/></fetched-with>
```

• If there is no fetched-with subelement of a cmr-field-mapping, fetched-with can have any valid subelement. The default subelement is as follows:

```
<fetched-with><none/></fetched-with>
```

Managed fields are multiple CMP or CMR fields that are mapped to the same column. A managed field can have any fetched-with subelement except <default/>. For additional information, see "Managed Fields" in GlassFish Server Open Source Edition Application Development Guide.

Superelements ^^^^

cmp-field-mapping, cmr-field-mapping (sun-cmp-mappings.xml)

Subelements ^^^^

The following table describes subelements for the fetched-with element.

Table C-58 fetched-with Subelements

Element	Required	Description
default	exactly one subelement is required	Specifies that a CMP field belongs to the default hierarchical fetch group, which means it is fetched any time the bean is loaded from a database. Enables prefetching of a CMR field.
level	exactly one subelement is required	Specifies the level number of a hierarchical fetch group.
named-group	exactly one subelement is required	Specifies the name of an independent fetch group.

Element	Required	Description
none	exactly one subelement is required	Specifies that this field or relationship is placed into its own individual fetch group, which means it is loaded from a database the first time it is accessed in this transaction.

field-name

Specifies the Java identifier of a field. This identifier must match the value of the field-name subelement of the cmp-field element in the ejb-jar.xml file.

Superelements ^^^^

cmp-field-mapping (sun-cmp-mappings.xml)

Subelements ^^^^

none - contains data

finder ~~~~

Describes the finders for CMP 1.1 with a method name and query.

Superelements ^^^^

one-one-finders (glassfish-ejb-jar.xml)

Subelements ^^^^

The following table describes subelements for the finder element.

Table C-59 finder Subelements

Element	Required	Description
method-name	only one	Specifies the method name for the finder.

Element	Required	Description
query-params	zero or one	Specifies the query parameters for the CMP 1.1 finder.
query-filter	zero or one	Specifies the query filter for the CMP 1.1 finder.
query-variables	zero or one	Specifies variables in query expression for the CMP 1.1 finder.
query-ordering	zero or one	Specifies the query ordering for the CMP 1.1 finder.

flush-at-end-of-method

Specifies the methods that force a database flush after execution. Applicable to entity beans.

Superelements ^^^^

ejb(glassfish-ejb-jar.xml)

Subelements ^^^^

The following table describes subelements for the flush-at-end-of-method element.

Table C-60 flush-at-end-of-method Subelements

Element	Required	Description
method	one or more	Specifies a bean method.

gen-classes~

Specifies all the generated class names for a bean.

This value is automatically generated by the server at deployment or redeployment time. Do not specify it or change it after deployment.

Superelements ^^^^

ejb(glassfish-ejb-jar.xml)

Subelements ^^^^

The following table describes subelements for the gen-classes element.

Table C-61 gen-classes Subelements

Element	Require d	Description
remote-impl	zero or one	Specifies the fully-qualified class name of the generated EJBObject impl class.
local-impl	zero or one	Specifies the fully-qualified class name of the generated EJBLocalObject impl class.
remote-home-impl	zero or one	Specifies the fully-qualified class name of the generated EJBHome impl class.
local-home-impl	zero or one	Specifies the fully-qualified class name of the generated EJBLocalHome impl class.

glassfish-application ~~~~~~

Defines the GlassFish Server specific configuration for an application. This is the root element; there can only be one glassfish-application element in a glassfish-application.xml file. See The glassfish-application.xml File.

Superelements ^^^^

none

Subelements ^^^^

The following table describes subelements for the glassfish-application element.

Table C-62 glassfish-application Subelements

Element	Required	Description
web	zero or more	Specifies the application's web tier configuration.
pass-by-reference	zero or one	Determines whether EJB modules use pass-by-value or pass-by-reference semantics.
unique-id	zero or one	Contains the unique ID for the application.
security-role-mapping	zero or more	Maps a role in the corresponding Java EE XML file to a user or group.
realm	zero or one	Specifies an authentication realm.
ejb-ref	zero or more	Maps the absolute JNDI name to the ejb-ref in the corresponding Java EE XML file.
resource-ref	zero or more	Maps the absolute JNDI name to the resource-ref in the corresponding Java EE XML file.
resource-env-ref	zero or more	Maps the absolute JNDI name to the resource-env-ref in the corresponding Java EE XML file.
service-ref	zero or more	Specifies runtime settings for a web service reference.
message-destination-ref	zero or more	Specifies the name of a physical message destination.
message-destination	zero or more	Specifies the name of a logical message destination.
archive-name	zero or one	Specifies the name of the archive file.
compatibility	zero or one	Specifies the GlassFish Server release with which to be backward compatible in terms of JAR visibility requirements for applications.
keep-state	zero or one	Retains web sessions, stateful session bean instances, and persistently created EJB timers across redeployments.
version-identifier	zero or one	Contains version information for an application.

glassfish-application-client

Defines the GlassFish Server specific configuration for an application client. This is the root element; there can only be one glassfish-application-client element in a glassfish-applicationclient.xml file. See The glassfish-application-client.xml file.

Superelements ^^^^

none

Subelements ^^^^

The following table describes subelements for the glassfish-application-client element.

Table C-63 glassfish-application-client subelements

Element	Required	Description
ejb-ref	zero or more	Maps the absolute JNDI name to the ejb-ref in the corresponding Java EE XML file.
resource-ref	zero or more	Maps the absolute JNDI name to the resource-ref in the corresponding Java EE XML file.
resource-env-ref	zero or more	Maps the absolute JNDI name to the resource-env-ref in the corresponding Java EE XML file.
service-ref	zero or more	Specifies runtime settings for a web service reference.
message-destination-ref	zero or more	Specifies the name of a physical message destination.
message-destination	zero or more	Specifies the name of a logical message destination.
java-web-start-access	zero or one	Specifies changes to default Java Web Start parameters.
version-identifier	zero or one	Contains version information for an application client.

glassfish-ejb-jar~

Defines the GlassFish Server specific configuration for an EJB JAR file. This is the root element; there can only be one glassfish-ejb-jar element in a glassfish-ejb-jar.xml file. See The glassfish-ejb-jar.xml File.

Superelements ^^^^

none

Subelements ^^^^

The following table describes subelements for the glassfish-ejb-jar element.

Table C-64 glassfish-ejb-jar Subelements

Element	Required	Description
security-role-mapping	zero or more	Maps a role in the corresponding Java EE XML file to a user or group.
enterprise-beans	only one	Describes all the runtime properties for an EJB JAR file in the application.
compatibility	zero or one	Specifies the GlassFish Server release with which to be backward compatible in terms of JAR visibility requirements for applications.
disable-nonportable-jndi-names	zero or one	Disables GlassFish Server specific JNDI names.
keep-state	zero or one	Retains stateful session bean instances and persistently created EJB timers across redeployments.
version-identifier	zero or one	Contains version information for an EJB module.

glassfish-web-app ~~~~~

Defines GlassFish Server specific configuration for a web module. This is the root element; there can only be one glassfish-web-app element in a glassfish-web.xml file. See The glassfish-web.xml File.

Superelements ^^^^

none

Subelements ^^^^

The following table describes subelements for the glassfish-web-app element.

Table C-65 glassfish-web-app Subelements

Element	Required	Description
context-root	zero or one	Contains the web context root for the web module.
security-role-mapping	zero or more	Maps roles to users or groups in the currently active realm.
servlet	zero or more	Specifies a principal name for a servlet, which is used for the run-as role defined in web.xml.
idempotent-url-pattern	zero or more	Specifies a URL pattern for idempotent requests.
session-config	zero or one	Specifies session manager, session cookie, and other session-related information.
ejb-ref	zero or more	Maps the absolute JNDI name to the ejb-ref in the corresponding Java EE XML file.
resource-ref	zero or more	Maps the absolute JNDI name to the resource-ref in the corresponding Java EE XML file.
resource-env-ref	zero or more	Maps the absolute JNDI name to the resource-env-ref in the corresponding Java EE XML file.
service-ref	zero or more	Specifies runtime settings for a web service reference.
message-destination-ref	zero or more	Specifies the name of a physical message destination.
cache	zero or one	Configures caching for web application components.
class-loader	zero or one	Specifies class loader configuration information.
jsp-config	zero or one	Specifies JSP configuration information.
locale-charset-info	zero or one	Deprecated. Use the parameter-encoding subelement of glassfish-web-app instead.
parameter-encoding	zero or one	Determines the default request character encoding and how the web container decodes parameters from forms according to a hidden field value.
property (with attributes)	zero or more	Specifies a property, which has a name and a value.
valve	zero or more	Specifies a custom valve.
message-destination	zero or more	Specifies the name of a logical message destination.

Element	Required	Description
webservice-description	zero or more	Specifies a name and optional publish location for a web service.
keep-state	zero or one	Retains web sessions across redeployments.
version-identifier	zero or one	Contains version information for a web application.

Attributes ^^^

The following table describes attributes for the glassfish-web-app element.

Table C-66 glassfish-web-app Attributes

Attribute	Default	Description
error-url	(blank)	(optional) Not implemented. Do not use.
httpservlet- security- provider	none	(optional) Specifies the HttpServlet message layer provider that the web container's servlet authconstraint processing calls.

Properties ^^^

The following table describes properties for the <code>glassfish-web-app</code> element.

Table C-67 glassfish-web-app Properties

Property	Default	Description
allowLinking	false	If true, resources in this web application that are symbolic links are served. You can also define this property for a virtual server. Web applications on the virtual server that do not define this property use the virtual server's value. For details, see create-virtual-server(1).
		Caution: Setting this property to true on Windows systems exposes JSP source code.

Property	Default	Description
alternatedocroot_n	none	Specifies an alternate document root (docroot), where n is a positive integer that allows specification of more than one. Alternate docroots allow web applications to serve requests for certain resources from outside their own docroot, based on whether those requests match one (or more) of the URI patterns of the web application's alternate docroots.
		If a request matches an alternate docroot's URI pattern, it is mapped to the alternate docroot by appending the request URI (minus the web application's context root) to the alternate docroot's physical location (directory). If a request matches multiple URI patterns, the alternate docroot is determined according to the following precedence order:
		• Exact match
		• Longest path match
		• Extension match
		For example, the following properties specify three alternate docroots. The URI pattern of the first alternate docroot uses an exact match, whereas the URI patterns of the second and third alternate docroots use extension and longest path prefix matches, respectively.
		<pre><property name="alternatedocroot_1" value="from=/my.jpg dir=/srv/images/jpg"></property> <property name="alternatedocroot_2" value="from=*.jpg dir=/srv/images/jpg"></property> <property <="" name="alternatedocroot_3" pre=""></property></pre>

Property Default	Description
Property valve_n none	This property is deprecated. Use the valve subelement instead. Specifies a fully qualified class name of a custom valve, where n is a positive integer that allows specification of more than one. The valve class must implement the org.apache.catalina.Valve interface from Tomcat or previous GlassFish Server releases, or the org.glassfish.web.valve.GlassFishValve interface from the current GlassFish Server release. For example: <pre> </pre> <pre> </pre> <pre> </pre> <pre> <pre></pre></pre>

Property	Default	Description
listener_n	none	Specifies a fully qualified class name of a custom Catalina listener, where n is a positive integer that allows specification of more than one. The listener class must implement the org.apache.catalina.ContainerListener, org.apache.catalina.LifecycleListener, or org.apache.catalina.InstanceListener interface. For example: <pre></pre>
crossContextAllowed	true	If true, allows this web application to access the contexts of other web applications using the `ServletContext.``getContext()`method
relativeRedirectAllowed	false	If true, allows this web application to send a relative URL to the client using HttpServletResponse. ``sendRedirect(), and instructs the web container not to translate any relative URLs to fully qualified ones.
reuseSessionID	false	If true, sessions generated for this web application use the session ID specified in the request.

Property	Default	Description
securePagesWithPragma	true	Set this property to false to ensure that for this web application file downloads using SSL work properly in Internet Explorer. You can set this property for all the web applications on a specific virtual server. For details, see create-virtual-server (1).
singleThreadedServletPoolSize	5	Specifies the maximum number of servlet instances allocated for each SingleThreadModel servlet in the web application.
tempdir	domain- dir`/generated/`app- name or domain- dir`/generated/`mod ule-name	Specifies a temporary directory for use by this web module. This value is used to construct the value of the <code>javax.servlet.context.``tempdir</code> context attribute. Compiled JSP files are also placed in this directory.
useResponseCTForHeaders	false	If true, response headers are encoded using the response's charset instead of the default (UTF-8).

```
group-map ~~~~
```

Maps an EIS group to a group defined in the GlassFish Server domain.

Superelements $^{^{\wedge\wedge\wedge\wedge}\wedge}$

work-security-map (glassfish-resources.xml)

Subelements ^^^^

none

Attributes ^^^

The following table describes attributes for the group-map element.

Table C-68 group-map Attributes

Attribute	Default	Description
eis-group	none	Specifies an EIS group.
mapped- group	none	Specifies a group defined in the GlassFish Server domain.

group-name

Specifies a group name in the current realm.

Superelements ^^^^

security-role-mapping (glassfish-application.xml, glassfish-web.xml, glassfish-ejb-jar.xml)

Subelements ^^^^

none - contains data

 $http\text{-method} \ ^{\wedge \wedge \wedge} \wedge$

Specifies an HTTP method that is eligible for caching. The default is GET.

Superelements
